

Zone Blitzes, Fire Zones, and Simulated Pressure

How a defense brings pressure without paying for it in coverage: rush the man the protection didn't count, drop the man it did, and make four rushers look like six.

Third-and-7, early in the fourth quarter. Before the snap the defense has six players standing on the line of scrimmage: four linemen, plus two linebackers who have walked right up into the gaps on either side of the center. A safety is creeping down toward the slot receiver. The center points, the quarterback points, somebody shouts a name, and you can feel the offense counting: six possible rushers, six blockers, and somebody has to be the “hot” throw if a seventh comes. At the snap one of the linebackers backs out. A 300-pound defensive end, a man who has rushed the passer on every snap of his career, turns and runs *backward*. The quarterback sees the blitz he expected, flicks the ball to his slot receiver on a quick slant, and throws it straight into the chest of the defensive end, who is standing exactly where the slant was going. On the replay the analyst draws a circle around the end and says one word: “zone blitz.” Why would a defense take its pass rusher out of the pass rush? How can rushing *fewer* people beat a protection built for more? This chapter is about pressure that doesn't cost coverage, and about the half-second after the snap in which the offense finds out who is really coming.

You'll be able to...

- Explain the zone-blitz trade: rush a defender the protection didn't count, drop one it did, and keep zone coverage behind the pressure, and say what the defense gives up to do it.
- Recognise a fire zone after the snap (five rush, three under, three deep, a lineman in coverage) and point to the holes every fire zone leaves, and why they move with each variant.
- Tell a simulated pressure (a “creeper”) from a blitz by counting rushers after the snap, and explain how four rushers can still beat a six-man protection.
- Narrate the protection-versus-pressure contest play by play: the Mike call, the slide, the hot throw, and the defense's answer to each.
- Read the pressure tells before the snap (mugged linebackers, walked-up safeties, the players who *could* drop) and add them to your watching checklist.

i You'll need

- **Blitzing:** a blitz sends five or more rushers. Blitz math counts rushers against blockers to find who is free and where the hot throw goes; the usual price is man coverage behind it, as in a Cover 1 blitz (one deep safety) or a Cover 0 blitz (none). Linebackers standing in both A gaps (the gaps beside the center) are a *double A-gap mug*, built to scramble the protection's count.
- **Pass Protection:** in slide protection linemen block gaps, in man protection they block men, and the half-slide mixes the two. Every assignment is counted from the defender named in the Mike identification. The back checks and releases. When rushers outnumber blockers, the quarterback throws a hot route into the space a blitzer left, or a receiver makes a sight adjust. A rusher nobody blocks is a free rusher.
- **Cover 3:** three deep, each guarding a deep third, and four under. The outside underneath defender is the curl-flat defender; its match version, who takes the slot receiver's vertical route first, is the seam-flat defender. Inside him is the hook zone.
- **The Pass Rush:** each rusher has a rush lane and the ends keep contain; a stunt swaps rushers' paths after the snap; pressure counts sacks, hits and hurries.
- **Disguise, Rotation, and Split-Field Coverage:** defenses disguise what they will play and rotate at the snap. This chapter applies the same idea to the rush.

How to read the diagrams. Offense is blue circles: the five linemen (LT, LG, C, RG, RT, or just C on wide pictures), Q the quarterback, R the running back, X and Z the outside receivers, H the slot receiver and Y the tight end (here flexed out like a second slot). Defense is outlined orange squares: E and T the defensive ends and tackles, M the Mike and W the Will linebacker, \$ the nickel back (the slot cornerback), CB the cornerbacks, FS and SS the free and strong safety. A **purple ring** marks a *dropper*, a lineman going into coverage; a red ring marks the rusher to watch. Solid orange arrows are rushers, dashed orange arrows are zone drops, short blue lines with a bar are blockers' sets, and blue arrows are routes. Left and right are the offense's.

The blitzer's dilemma

Start with the problem the zone blitz was invented to solve. A defense that wants to hit the quarterback has two ways to do it. It can win with four, beating blockers one on one (The Pass Rush), which needs great rushers and time. Or it can add rushers (Blitzing): send five or six, more than the offense can block, and get someone there before the ball is out.

The second way has a bill attached, and the bill is paid in coverage. Eleven defenders, minus six rushers, leaves five to cover five eligible receivers. With nobody to spare, the defense almost always plays man coverage behind a big blitz: each cover man takes one receiver, with one deep safety at most. That is the Cover 1 or Cover 0 blitz of the previous chapter, and it has three weaknesses offenses have known about for fifty years.

1. **The hot throw.** A blitzer is a defender who isn't covering. The offense designs a route into the space he left and throws it before he arrives (hot routes again). Against man coverage, that hot receiver has only his own defender to beat, and that defender is the one who just blitzed.
2. **One missed tackle is a touchdown.** In man coverage with no deep safety, every cover man is alone. A slant caught in stride with no help behind can go the distance.
3. **Man coverage needs men who can cover.** A linebacker or a safety on a fast slot receiver is a matchup offenses hunt for, and the blitz makes the defense play a lot of them.

So the question that drove a generation of defensive coaches was: *can we get the confusion and the pressure of a blitz without playing man coverage behind it?* Bill Arnsparger, the Dolphins' defensive coordinator, had a two-word answer that Dick LeBeau would carry into his own career: **safe pressure**.

! Why it exists

A blitz trades coverage for pressure. The zone blitz tries to break the trade. Its central insight is that a protection doesn't count *how many* defenders rush so much as *which* ones. Pass protections assign blockers to the defenders most likely to rush: linemen first, then the linebackers nearest the line. Rush one the protection wasn't counting, take away one it was, and the defense can create a free rusher or a mismatch *with the same number of rushers*, while the players it didn't send still play a sound zone behind the rush.

The zone blitz: rush one they didn't count, drop one they did

A **zone blitz** is a pressure that sends a defender the offense does not expect to rush (a linebacker or a defensive back) and drops one it does expect to rush (usually a defensive lineman) into a short zone, so the defense pressures the quarterback and still plays zone coverage behind the rush. That lineman-turned-coverage-player is the scheme's signature, and coaches call him a **dropper**: a defensive lineman, or an edge rusher who normally rushes, who drops into a short zone at the snap.

On first hearing it sounds absurd. Why take a 290-pound defensive end, the man you pay to rush, and ask him to cover a receiver? There are three answers, and they explain the whole family.

He isn't covering a receiver. He is standing in a lane. The dropper's job is almost never "run with that slot receiver." It's "get five or six yards deep, into the spot where the quarterback's hot throw is supposed to go, and turn around." Think back to how the offense handles a blitz: it designs a quick throw into the area the blitzer left, and the quarterback, seeing a blitz, throws it without waiting. The dropper fills that exact area. The quarterback isn't reading the coverage when he throws hot; he is reacting to the rush. So a slow, big man can make the play, because the ball is coming to him. Linemen also have long arms and are used to getting their hands up in throwing lanes.

His absence is the point. The offensive tackle across from him was counting on blocking him. When he drops, that tackle has nobody, and a blocker with nobody to block is a blocker the defense has taken out of the play. Meanwhile someone the protection didn't count is coming from somewhere else.

The coverage stays zone. Because the defense swapped one rusher for another instead of adding rushers, it still has six or seven players in coverage, enough to play a real zone with deep help. Zone defenders watch the quarterback, not a receiver, so they see the throw coming and break on it. And nobody is left alone in man coverage with no safety behind him.

Figure 1: A 1990s-style zone blitz from a 3-4 front, the kind the ‘Blitzburgh’ Steelers made famous (illustrative, not a specific play from their playbook). The offense is in a two-back I formation (21 personnel), the everyday look of that era. Five rush: the strong safety (SS) off the edge on the tight end’s side, the Mike (M) through the B gap, the nose (N), the weak-side end and outside linebacker (B). Six cover, three deep (both corners and the free safety) and three under, and two of the three underneath players (ringed purple) are men the protection had counted as rushers: the strong-side defensive end (E) drops into the hook and the strong-side outside linebacker drops to the flat. The 3-4 suited this beautifully: its outside linebackers rush like ends on most snaps but can also cover, so the offense can’t tell before the snap which of them is coming.

The picture above is the zone blitz in its classic form, from the 3-4 defenses where it grew up. Count the arithmetic first. Five rush, six cover, and the six split into **three deep** (each defender guarding a third of the field’s width, as in Cover 3) and **three under**. Offenses of that era often kept six or seven men in to block on a pass (five linemen plus a back, often a tight end too), so five rushers aren’t an overload at all. What makes it work is *who* the five are. The protection was built to block the three down linemen and the two outside linebackers, the five men who usually rush. Instead, one of those (the strong-side end) drops, a second (the strong outside linebacker) drops, and the two replacements (the Mike and the strong safety) come from places the blocking rules may assign to a back, or to nobody.

🔥 Common misconception

“A zone blitz is a blitz with zone coverage.” Close, but it misses the key move. Plenty of five-man pressures play zone behind them without dropping anybody unexpected. What makes a zone blitz a zone blitz is the **exchange**: a player the offense expects to rush drops, and a player it expects to cover rushes. Take away the exchange and you have a blitz with thin zone coverage behind it, which is the worst of both worlds: fewer cover men *and* rushers exactly where the protection expected them.

What a zone blitz gives up

Nothing is free, and a coach calling one knows exactly what he’s betting.

- **A pass rusher.** The dropper is usually a good rusher, now jogging backward. If the replacement rusher is a 205-pound safety and the protection picks him up anyway, the defense has traded a good rusher for a worse one.
- **Underneath space.** Three underneath defenders can’t cover the width of the field (more than 53 yards) the way four or five can. There are always gaps between them, and the dropper, slow and starting from the line, is the slowest to get to his spot.
- **Run defense.** Linemen dropping and linebackers flying through gaps at the snap is a gamble against a run, because the run fits (Run Fits and Box Math) are all reassigned. That is why zone blitzes are mostly a passing-down call.
- **Time to install.** Every exchange is new homework for the players involved: an end learning a hook drop, a safety learning to take on a guard. Defenses that live on pressure spend practice time here that others spend on other things.

The fire zone: three under, three deep

The most common zone blitz has its own name. A **fire zone** is a five-man pressure with three defenders deep, each guarding a third of the field, and three underneath: a seam-flat defender on each side and one in the middle, usually with a defensive lineman as one of the three. Coaches also call it a 3-under 3-deep pressure, or “3 under, 3 deep,” which tells you its whole structure in four words.¹

Why three deep? Because the deep thirds are the part of the field where a mistake costs a touchdown, and the fire zone refuses to take that risk. With a defender in each deep third, no receiver should get behind the defense, which is the opposite of a Cover 0 blitz. The defense pays for those three deep players underneath, where it has only three to cover what four or five usually do. Its bet is that the five-man rush will make the quarterback throw before receivers can find those underneath gaps, and that the throws it gives up are short ones, caught in front of defenders who are watching the quarterback and can rally to tackle.

Who plays the three underneath spots? The two outside ones are **seam-flat** players, and here is why the match version of Cover 3 matters (Cover 3). With only three underneath, nobody else can stop a slot receiver from running straight up the seam, between the deep thirds. So each seam-flat defender’s first job is the #2 receiver’s vertical route: wall it, carry it until a deep defender takes over, and only then work to the flat. The middle player sits in the hook, often called the “3 hole” or “hot hole,” in front of the deep middle safety. That middle spot is where the dropper usually goes, because it’s the closest zone to where he started and it’s where the quick inside throw against a blitz wants to go.

¹The definition follows Chris B. Brown, “Controlled Chaos,” *Grantland* (Sept. 26, 2012), cited in full in the note on Arnsperger and Matheson: “The most common modern zone blitz is the ‘fire zone,’ a five-man blitz behind which the defense plays coverage with three defenders deep and three underneath.” “Fire zone” is also used loosely for any zone pressure; staffs differ.

Figure 2: Fire zone against a 2x2 shotgun set, as a frame strip (the web version is a video). (1) Before the snap the Will (W) creeps toward the line: a pressure look. (2) At the snap the Will and the Mike (M) blitz the B and A gaps while the left defensive end (E, purple ring) turns and drops; the dashed outlines mark where they started. Five rush: the two linebackers, both tackles and the right end. (3) The quarterback sees two linebackers coming and does what he is coached to do: throw hot, at once, to the slot receiver (H) breaking into the space the Will left. (4) The end is standing in that space. Behind him the defense is three deep (both corners and the free safety in thirds) and three under (the nickel and the strong safety are the seam-flat players; the SS carries Y up the seam). Six blockers handled five rushers perfectly; the defense won with the man it took out of the rush.

Walk through the strip from the quarterback's side, because the fire zone is designed against his habits. Before the snap he sees the Will creeping up. His protection can handle it: six blockers for the six likely rushers (four linemen, two linebackers). He has also been told, in the play call, who his hot receiver is if more come than his line can block. At the snap he sees exactly what he feared: both linebackers coming. He doesn't count blockers; he trusts his rule and throws hot. And the rule is what the defense attacked. The ball goes to the spot the blitzers emptied, which the end has just refilled.

Notice what the defense *didn't* do. It didn't beat the protection: five rushers, six blockers, all blocked. It didn't need to. A fire zone wins in one of three ways: a free rusher if the protection counts wrong (next section), a hurried throw into a dropper, as here, or simply a throw short of the sticks on third down, made into a zone with three defenders rallying to the ball.

Count to eleven

Here is the most useful bit of arithmetic in this part of the book. Every defense has eleven players, and every one of them is a **rusher**, an **underneath** cover man, or a **deep** cover man. Fix any two of those numbers and the third is decided.

Call	Rush	Under	Deep	Behind it
Four-man rush, Cover 3	4	4	3	zone

Call	Rush	Under	Deep	Behind it
Four-man rush, quarters or Cover 2	4	5	2	zone
Fire zone	5	3	3	zone (three under, three deep)
Simulated pressure (Cover 3 behind)	4	4	3	zone
Cover 1 blitz	5–6	4–5	1	man
Cover 0 blitz	6	5	0	man

Before the snap you can usually count the deep defenders, the safeties 12 or more yards deep and any corner well off his receiver. That count caps everything else. A defense showing three deep players can rush at most five and still have three underneath; showing two deep safeties and two off corners, it is very unlikely to bring six. And after the snap, counting rushers and deep defenders tells you what you just watched: five rush and three deep is a fire zone; four rush, with somebody unexpected among them, is the simulated pressure coming up below.

Where the holes are

Every fire zone has the same basic weakness: three underneath defenders spread across the field leave gaps between and behind them. But which gaps are biggest depends on *who* drops, because the holes live next to the slowest dropper. A defensive end who starts on the line of scrimmage can get five or six yards deep before the quarterback throws a quick pass; he cannot get to 12 yards and he cannot get to the sideline. So the variant tells you where to throw.

Figure 3: Three fire-zone variants against the same 2x2 set, and the hot-zone holes each one leaves (red). In every variant five rush, three play deep thirds, and three play underneath zones (the shaded ovals); what changes is who comes, who drops, and therefore where the holes are. A: Edge fire. The nickel (\$) and Will rush from the left, and the left end (purple ring) drops into the slant window. The holes are on the left: the curl behind and outside the dropping end at 10 to 14 yards, and the flat he can never reach. B: Inside fire. Both linebackers rush the A gaps and the 1-technique tackle drops into the hook; a tackle can only get about four yards deep, so the windows over his head at 10 to 14 yards, on either side of the deep middle safety, are open. C: Corner fire. The right corner rushes off the edge and the strong safety rotates out to the deep third he left. Z, uncovered on the line, is open for a quick hitch in front of the rotating safety, and the right end dropping into the seam-flat zone leaves room behind him.

Read the three panels as a quarterback would. Against the **edge fire** (A), he doesn't throw the hot slant into the dropping end; he throws behind him, a curl or a quick out to the left, where an end starting on the ball can't get. Against the **inside fire** (B), the threat is right up the middle, and so is the hole: the dropping tackle walls off the short middle, so the answer is an in-cut at 12 yards, over his head. Against the **corner fire** (C), the hole is the receiver the corner left: a quick hitch or a back-shoulder throw to Z before the rotating safety arrives. Offenses build their "zone-blitz beaters" around exactly these spots, and defenses answer by moving the exchange around, so that the quarterback can't know before the snap which three windows will be open.

! Why it exists: the fire zone's bargain

What it buys. Five rushers, an exchange that puts the protection's assignments in the wrong place, and three deep defenders, so the worst case is usually a completed short pass rather than a long touchdown. Zone defenders facing the quarterback can break on hot throws, and a dropper can turn a quick throw into an interception.

What it gives up. Underneath width (three defenders where four or five usually play), a pass rusher turned into a coverage player, and run defense. A quarterback who reads it after the snap and throws into the hole next to the slowest dropper, or a play caller who gets the ball out in under two seconds to the open grass, beats it. So does a protection that simply counts right.

Why the protection loses: rules, not people

Now the contest from the offense's side, because the zone blitz is aimed less at players than at the **rules** the protection uses. Before the snap the offense has to make three decisions, all on the basis of what the defense shows (Pass Protection):

1. **Mike ID.** The quarterback or center names one defender as the "Mike," the reference point every blocker counts from.
2. **The slide.** The line slides toward the biggest threat: the side with more possible rushers, or the most dangerous inside rusher. The man the slide leaves behind belongs to the back.
3. **The hot.** If more defenders come than the protection can block, somebody is free; the quarterback and his hot receiver must know where that somebody would come from and where the ball goes.

Each of those decisions is a prediction about who will rush, made from where defenders stand. And that is the opening the defense attacks with a **pressure look**: a pre-snap alignment that shows more possible rushers than the offense can comfortably block (linebackers walked up into the A gaps, a safety or nickel creeping toward the line), whether or not they will rush. A pressure look's job isn't to rush. It is to make the offense commit its slide, its back and its hot throw before the snap, so that the defense can bring pressure from wherever the commitments aren't.

Figure 4: Protection bust: slide toward the threat, rush from the other side. Before the snap the defense walks the Mike (M) up into the right A gap and the strong safety (SS) down to the right edge, a pressure look on the right. By its rules the offense slides its line right, toward the threat, and gives the back the left end, the man the slide leaves. At the snap all three threats on the right never come: the Mike, the SS and the left end (all purple ringed) drop. Five rush from where the protection didn't look, and the nickel (\$, red ring) comes off the left edge untouched. Count the blockers: the center slid into the Mike's empty gap and the back set up on an end who left, so two of the six blocked nobody. The quarterback's hot throw, the slot receiver's slant into the space the nickel left, now runs into the dropping end. Illustrative, from a typical half-field view of the box.

This is the protection-versus-pressure contest in four moves, and once you know it you will see it on nearly every third-and-long.

1. **The defense shows.** Six or seven possible rushers line up near the line. Two linebackers mug the A gaps, or a safety walks down beside an end. The offense can't block seven with six, so it has to guess which of them matter.
2. **The offense commits.** The center names the Mike; the line slides toward the side with more threats; the back is assigned to the leftover man; the quarterback and his hot receiver note where a free rusher would come from. A good offense also *checks*: it might keep a tight end in, or change a route so a hot throw is ready on the dangerous side.
3. **The defense answers at the snap.** The threatening side drops, the quiet side comes. Linemen block air, the back sets up on a man who isn't coming, and the rusher nobody counted is free, or facing a back instead of a lineman.

4. **The quarterback has about a second.** If he sees it, he throws hot, or away from the droppers, or he slides in the pocket and throws to the hole. If he doesn't, he is sacked from a side he thought was safe, and the broadcast blames a lineman who did exactly what his rules told him.

i Madden vs. real life

In Madden the defense calls a “zone blitz” from a menu, and the computer’s quarterback simply throws to whoever is open. Real zone blitzes work because a real offense has to *agree* on its protection out loud, in a few seconds, from what the defense shows, and then every lineman follows his rule even when the rule is wrong for the rush that comes. The defense’s play call is aimed at those rules and at the quarterback’s habits (throw hot when a linebacker comes), not at the receivers. That is why the same zone blitz can be a sack against one offense and a 15-yard completion against another: the defense is attacking the offense’s *system*, and systems differ.

Offenses fight back with the same weapons they use against disguise (Disguise, Rotation, and Split-Field Coverage). They change the Mike late to move the slide. They keep the back in with a dual read, checking two defenders in turn instead of one. They use **“hot” routes that read the coverage** rather than the rush, so that a receiver breaks away from a dropper instead of into him. They empty the backfield to make the defense declare its rush (with no back to protect, the line slides and the quarterback alone handles the leftover man). Above all, they **throw quickly to the holes**: a 1.5-second throw to the flat or a hitch is over before any exchange has finished. Each answer is a little cheaper than the pressure it beats, which is why the contest never ends.

Simulated pressure: four that look like six

The fire zone still sends five. The modern idea goes one step further: send only **four**, from unexpected places, and keep **seven** in coverage. That is **simulated pressure**, a four-man rush built to look like a blitz: one or more players the protection expects to rush drop into coverage, and one or more it expects to cover rush instead, so the defense gets a blitz’s confusion with seven players still in coverage. You will hear it shortened to **sim pressure** or “sim,” and many coaches call it a **creeper**, because an off-ball defender “creeps” into the rush to replace the lineman who drops. Ted Nguyen of *The Athletic* puts the broadcast version simply: multiple defenders on the line showing blitz, but the defense rushes only four and drops seven.²

Why would four ever be enough against a protection of six? Because, again, protection is assignments, and assignments are predictions. A six-man protection doesn’t put six blockers on four rushers; it puts specific blockers on specific *possible* rushers. If the right four come, at least one blocker has nobody, and one of the four may face a back instead of a lineman, or arrive in a gap that a sliding lineman has just left. The defense hasn’t out-numbered the offense. It has out-*positioned* it, and it still has seven men covering five receivers.

²Brad Beatson, “Brian Flores: The Bogeyman,” Sports Info Solutions (Oct. 31, 2024): <https://www.sportsinfosolutions.com/2024/10/31/brian-flores-the-bogeyman>, quoting Ted Nguyen of *The Athletic*: simulated pressure is “multiple defenders on the line of scrimmage showing blitz but the defense only ends up rushing four and dropping seven into coverage.”

Figure 5: A creeper from the nickel, as a frame strip (the web version is a video). (1) The pressure look: six defenders at the line, with the Mike (M) mugged in the right A gap, and the nickel (\$) creeping down over the slot receiver (H). The offense half-slides right, toward the Mike: the center, right guard and right tackle slide; the left guard and left tackle block the men in front of them; the back checks the Will. (2) At the snap the Mike backs out to the hook and the left end (purple ring) drops. (3) H is the quarterback's hot receiver, because his defender, the nickel, is rushing, but the dropping end is sitting in H's slant window. Behind the rush it is Cover 3: corners and free safety deep, four underneath. (4) Only four rushed, against six blockers, yet the center had no one to block, the left tackle set for an end who left, and the back, who waited for a Will who never came, is late to the nickel.

Look at what the creeper did to each blocker. The center slid toward the Mike, and the Mike left: one blocker gone. The left tackle set up for the end, and the end dropped: another blocker gone, at least for the second it takes him to find new work. The back's rule told him to check the Will, so he waited for a Will who dropped instead, and by the time he turned to the nickel the nickel was on top of him at full speed. Four rushers against six blockers, and the offense ended up with one tired back against a running start. And the quarterback's escape valve, the hot throw to H, is the one throw the defense took away, with a man the offense had planned to block.

That is the deal simulated pressure offers, and it explains why it spread through the NFL in the 2020s:

- **It keeps seven in coverage.** A fire zone has three underneath; a creeper has four, or five with two deep safeties. The holes of the previous section mostly close.
- **It wins one-on-ones instead of numbers.** The rush doesn't need a free man; it needs a *better* matchup than a normal four-man rush gets: a nickel against a back, a linebacker in a gap a lineman vacated, a defensive tackle against a center who just helped somebody else.
- **It attacks the rules without the risk.** If the protection guesses right, the defense is no worse off than in a normal four-man rush with a funny-looking front. If it guesses wrong, the defense gets a free rusher, or a hot throw into a dropper, at no extra cost.

- **It looks identical to the real thing.** Because the same pressure look can hide a creeper, a fire zone or a Cover 0 blitz, the offense can never safely ignore it. That is the link to the next chapter’s subject and the last one’s: the defense’s pre-snap picture is designed so that it never answers the offense’s question.

The price of the creeper

It isn’t free either. Four rushers means no numbers advantage, so if the exchange doesn’t confuse anyone the quarterback has the same time as against any four-man rush, with a defensive lineman now in coverage rather than in his face. A defensive tackle dropping into a zone is a real coverage liability if a receiver runs into his area with room to work, and every creeper takes a good pass rusher out of the rush. Simulated pressure is also hard to teach: the four rushers have to keep their rush lanes (The Pass Rush) even though they started in odd places, or the quarterback escapes through the gap the dropper left. Defenses that do it best have unusual players: versatile edge players who can drop, safeties and nickel backs who can rush, and linemen mobile enough to look like they belong in a hook zone.

What the charting data says

In public data the closest thing to a simulated-pressure flag comes from FTN’s charters, who record for every dropback how many players rushed and how many of those were *blitzers*, rushers who weren’t down linemen. Four rushers with at least one blitzer means somebody who usually rushes didn’t. It’s an imperfect proxy: it misses creepers in which the dropper and his replacement are both on the line (say, an end drops and a stand-up outside linebacker beside him rushes), and it counts some plain three-down-linemen fronts as sims. With that caution, here is what each kind of rush bought in 2023–2025.³

Figure 6: What each kind of rush buys, all NFL regular-season dropbacks 2023–2025 charted by FTN. ‘Four, incl. an off-ball rusher’ is four rushers of whom at least one is not a down lineman (the closest public proxy for simulated pressure). It produced pressure and sacks at nearly the rate of five-plus blitzes, while the coverage behind it was man about as often as behind a normal four-man rush (most of the time it was zone), not the majority-man of the blitz. EPA per dropback is from the offense’s side: lower is better for the defense. Whiskers are 95% confidence intervals; the simulated-pressure sample is small, so read the EPA gap as suggestive, not settled. Man/zone shares come from the charters’ coverage labels, which have shifted between seasons; compare the rows, not the levels. Source: nflverse play-by-play, participation and FTN charting data.

Three things stand out. First, the proxy for simulated pressure got the quarterback under pressure on 36% of dropbacks, close to the 39% of a real blitz and well above the 27% of a normal four-man rush; its sack rate (7.9%) matched the blitz’s (8.0%). Second, it got there with zone coverage behind it most of the time: the coverage was man on 35% of these plays, about the same as behind a normal four-man rush (33%) and far below the 60% behind a blitz. That is the creeper’s whole promise, in two numbers: blitz-like pressure, four-man-rush coverage. Third, offenses did worst against it, in expected points added (EPA) per dropback, though the sample is small (simulated pressure by this definition was only 4.7% of dropbacks) and the uncertainty is wide. Defenses also choose when to call it, and that choice is part of what the number measures.

There is a lesson in the rarity, too. If simulated pressure is this good, why isn’t it called more often? Partly because the proxy undercounts it. But mostly because it works *only* as a surprise. A creeper that the offense expects is just a four-man rush with a

³Course calculation from nflverse play-by-play, `load_participation()` and `load_ftn_charting()`, 2023–2025 regular seasons, dropbacks with FTN’s `n_pass_rushers` and `n_blitzers` recorded. Rush types: four rushers and no blitzers; four rushers with at least one blitzer (the simulated-pressure proxy); five or more. Pressure = FTN’s `was_pressure` or a sack. Man share = plays charted `MAN_COVERAGE` among those charted man or zone. FTN’s data dictionary defines `n_blitzers` only as “number of blitzers”; reading it as rushers who were not down linemen fits the counts (most four-man rushes have none; most five-man rushes have one) but is the course’s interpretation.

defensive tackle playing a hook zone. Its value depends on the offense having to respect the blitz, which is why the teams that sim the most also blitz a lot, or at least show it.

Where it came from: Miami, Cincinnati, and “Blitzburgh”

Who invented the zone blitz depends on whom you ask, and the honest answer is that it grew in stages, with each coach building on the last.

Bill Arnsparger’s Dolphins. Arnsparger was Don Shula’s defensive coordinator in Miami in two stints (1970–73 and 1976–83), a quiet, meticulous coach whose units were famous for being greater than their parts: the “No-Name Defense” of the early 1970s and the “Killer B’s” of the 1982 Super Bowl team.⁴ In the early 1970s he used linebacker Bob Matheson, who could rush like an end or cover like a linebacker, as a defensive end in the 4-3; with Matheson on the line, the defense could send five and still cover with six without the offense knowing which five. “With Bob there, with linebacking skills, we were able to rush five guys and cover with six,” Arnsparger later explained. “That’s what you need to run a zone blitz.” His catchphrase for what he was after was “safe pressure.”⁵ Some histories therefore date the zone blitz to Arnsparger’s Miami defenses of the early 1970s. Others point instead to the blitzes and zone-based defenses he tinkered with in the late 1970s and early 1980s, the Killer B’s years, as the more direct ancestor of what came next.⁶

Dick LeBeau’s Bengals. Dick LeBeau had been a Hall of Fame cornerback for the Lions (1959–72, 62 interceptions) before he started coaching. He became Cincinnati’s defensive coordinator in 1984, facing Bill Walsh’s 49ers and the precise, quick passing games spreading through the league, offenses that ate man-coverage blitzes alive with hot throws.⁷ Around the time he took the job he visited Arnsparger, by then the head coach at LSU, and came away with the “safe pressure” idea, which he then built into a system: linebackers and defensive backs rushing from many angles, linemen dropping, zone coverage behind. LeBeau later remembered one of the early tries: “We ran the zone blitz and the quarterback just threw the ball straight to Ken Riley,” the Bengals’ cornerback.⁸ The arrival of safety David Fulcher in 1986, a big man who could rush and cover, let him expand it.

Blitzburgh. The scheme became famous in Pittsburgh. Bill Cowher’s Steelers hired Dom Capers as defensive coordinator in 1992 (he stayed through 1994, then left to become the first head coach of the Carolina Panthers) and LeBeau as defensive backs coach; LeBeau was coordinator in 1995–96 and again from 2004 to 2014.⁹ Cowher called the scheme “a collaboration between myself and Dom Capers and Dick LeBeau.” With a 3-4 front whose outside linebackers could both rush and drop, the 1994 Steelers led the NFL in sacks with 55, a franchise record, and the city got a nickname.¹⁰ LeBeau’s own description, decades later, is still the best one-sentence summary of the idea: “It’s a zone area where you would blitz a guy that normally doesn’t blitz and make the quarterback figure out what’s going on.”

So which is it? Arnsparger had the principle (safe pressure, a player who could rush or drop) and was using linebackers on the line by the early 1970s and zone pressures in the early 1980s. LeBeau, by his own account, took the idea from Arnsparger and turned it into a full system in Cincinnati in the mid-1980s, and LeBeau and Capers made it famous in Pittsburgh in the 1990s. Both claims are true in their way; this book gives Arnsparger the idea and LeBeau the system. From Pittsburgh it spread with the coaches: Capers took it to Carolina, and in the 1990s and 2000s the fire zone became a standard call for almost every NFL defense, especially

⁴“Bill Arnsparger,” Wikipedia: https://en.wikipedia.org/wiki/Bill_Arnsparger (Dolphins defensive coordinator 1970–73 and 1976–83, Giants head coach 1974–76, LSU head coach 1984–86; the No-Name Defense and the Killer B’s). ⁹“Dom Capers,” Wikipedia: https://en.wikipedia.org/wiki/Dom_Capers (Steelers defensive coordinator 1992–94; Panthers head coach 1995–98; Texans head coach 2002–05; Packers defensive coordinator 2009–17).

¹⁰Steelers.com, “A Steelers Story: Birth of Blitzburgh set to premiere” (Dec. 11, 2024): <https://www.steelers.com/news/a-steelers-story-birth-of-blitzburgh-set-to-premiere> (the Cowher and LeBeau quotes; 1994 as the first year of “Blitzburgh”). Sacks: Steelers.com, “1994 AFC Divisional Playoffs”: <https://www.steelers.com/news/1994-afc-divisional-playoffs-957069> (“The Steelers also would go into the playoffs as the NFL’s leader in sacks, and the 55 they racked up also set a franchise record”).

once Nick Saban and Bill Belichick's pattern-matching rules, worked out in the early 1990s, gave the three underneath defenders a better way to handle routes than spot-dropping.¹¹

i Film room: Steelers, Super Bowl XLIII (Feb. 1, 2009) — the dropper who wasn't supposed to be

The most famous coverage drop in Super Bowl history was an accident of the zone-blitz mindset. Last seconds of the first half, Arizona at Pittsburgh's 1-yard line. The Steelers, with LeBeau as coordinator, showed a big blitz, and outside linebacker James Harrison, that season's Defensive Player of the Year and the Steelers' most dangerous edge rusher, was one of the players the Cardinals had to account for. Kurt Warner, expecting pressure, threw a quick slant to Anquan Boldin, and Harrison, who had dropped instead of rushing, was standing in the lane. He caught it at the goal line and ran 100 yards for a touchdown. "We had a play call where we were basically on a max blitz," Harrison said afterward. "Kurt had to get it out, so he had to throw a quick slant in or out, and I guessed on in." Accounts differ on exactly what Harrison's assignment was and how much of the drop was his own read.¹²

What to notice: the play is the zone blitz's logic in pure form. The quarterback reacted to the pressure he expected, threw the hot route to the spot the blitz should have emptied, and a man he had counted as a rusher was standing in it. You can see the same shape, on purpose, in the fire-zone strip earlier in this chapter.

The modern sim defenses

By the 2020s the fire zone was standard equipment, and offenses had answers to it: quick throws, empty sets, protections that counted the zone-blitz exchanges. The frontier moved to four-man simulated pressure, played with two-high coverage behind it as often as Cover 3. Three defenses of the 2020s are worth knowing.

i Film room: Ravens 2023 — Mike Macdonald's lie about who is coming

Mike Macdonald was Baltimore's defensive coordinator in 2022 and 2023 before becoming the Seahawks' head coach in 2024. His 2023 Ravens became the model modern pressure defense without being a heavy-blitz defense at all: they blitzed on about 21.5% of dropbacks, below the league average, by one count in December. What they did instead was lie. Macdonald "leaned into simulated pressures, making it look like they're blitzing when they're not, or disguising where exactly the pass rush is coming from," and he was willing to drop 355-pound nose tackle Michael Pierce or 338-pound Travis Jones into coverage.¹³ Cody Alexander's charting that October ranked Baltimore among the league's heaviest users of simulated pressure, with "a deep bag of simulated pressures at their disposal" and a defense "not afraid to drop interior defensive linemen."¹⁴ The Ravens finished 2023 with 60 sacks, the most in the NFL, and allowed 16.5 points a game, the fewest.¹⁵

What to notice: on a Ravens third down from 2023, count the players standing at the line before the snap, then count the rushers after it. Then find the biggest man in coverage. Kyle Hamilton, a 6-foot-4 safety, is often the rusher you didn't expect; a defensive tackle is often the dropper. Macdonald's Seattle defenses carried the same ideas into his head-coaching years: the 2025 Seahawks allowed the fewest points in the league (17.2 a game) and won Super Bowl LX, 29–13 over New England. How his defense combines this pressure with a two-high coverage shell is the second half of Case Study: Fangio's Two-High Revolution and Macdonald's Answer.

¹¹Pattern-matching origins (Saban and Belichick, early 1990s) as the basis of modern fire-zone coverage: Brown, "Controlled Chaos" (cited in full above).

¹²Harrison's quote: "Harrison's interception return TD sets Super Bowl record," Patriots.com (Feb. 1, 2009): <https://www.patriots.com/news/harrison-s-interception-return-td-sets-super-bowl-record-105901> (the pass was intended for Anquan Boldin on a slant; that report says Harrison's job was coverage on the running back). Other accounts describe the call as a zero blitz with Harrison assigned to rush, dropping on his own read.

¹³Kyle Goon, "Mike Macdonald has made the Ravens' defense shine. How long until he becomes a head coach?," *The Baltimore Banner* (Dec. 26, 2023): <https://www.thebanner.com/sports/ravens-nfl/ravens-mike-macdonald-kyle-hamilton-defense-nfl-head-coaching-4PJFXVUVPNZYGTWWQQRWGV3MY/> (the 21.5% blitz rate, the simulated-pressure quote and the Pierce and Jones weights, as of late December 2023).

¹⁴Cody Alexander, "Cool Clips: The Ravens 'Tag' Sim vs. the Lions," MatchQuarters (Oct. 30, 2023): <https://www.matchquarters.com/p/baltimore-ravens-tag-sim-vs-lions-mike-macdonald> (Alexander ranks the Ravens 4th in his simulated-pressure rate at that point of 2023).

¹⁵Course calculation from nflverse 2023 regular-season play-by-play (team sacks: Baltimore 60, the league high) and schedules (points allowed per game: Baltimore 16.5, the league low). Seattle 2025 (17.2 points allowed a game, the league low) from the same schedules; Super Bowl LX result from planning/FACTS-current.md §1.

i Film room: Vikings 2023–2024 — Brian Flores and the blitz you have to respect

Brian Flores, Minnesota’s defensive coordinator since 2023, shows the other half of the bargain: a creeper only fools an offense that fears the blitz, and nobody had more reason to fear it than Flores’s opponents. In 2023 the Vikings rushed five or more on 51% of dropbacks in FTN’s charting, the most in the league. In 2024 they blitzed less and simmed more: by the FTN proxy, 11.3% of their dropbacks were four-man rushes including an off-ball rusher, the second-highest rate in the NFL behind Tampa Bay (12.1%), coached by Todd Bowles, another longtime pressure designer.¹⁶ Sports Info Solutions found that through Week 8 of 2024 the Vikings got pressure on 35% of dropbacks when they rushed four or fewer, sixth in the league, and on 34% when they blitzed, 27th: the four-man rushes from blitz looks were doing more work than the blitzes.¹⁷

What to notice: a Vikings passing down often starts with six, seven, even eight defenders near the line. Before the snap, find the players who *could* drop (the stand-up edge players, any lineman in a two-point stance) and the ones who could rush (the linebackers, the nickel, a safety). After the snap, count. If four came, find the man who dropped and the man who replaced him. The point isn’t any single call; it’s that every call starts from the same picture.

Steve Spagnuolo, Kansas City’s coordinator since 2019 and the architect of the 2007 Giants’ pass rush, belongs on the list too: better known for his man-coverage blitzes (Blitzing), his 2023 Chiefs were also one of the league’s heavier sim users (sixth by the FTN proxy, at 6.8%) and finished with 57 sacks, second only to Baltimore.

Third down: when to blitz in zone and when in man

Simulated pressure and fire zones aren’t a defense; they are calls, and coordinators save them for particular situations. The cleanest pattern is on third down. On third-and-short, a fire zone hands the offense exactly what it wants, a short throw in front of three underneath defenders, so a defense that blitzes there usually plays man behind it, to take the short throw away. On third-and-long the calculation flips: the short throw the fire zone concedes is now short of the line to gain, so the defense can rally and tackle, and zone pressure becomes far more common.

Figure 7: On third-and-long, a blitz comes with zone coverage behind it (fire zones and other zone pressures) far more often than on third-and-short or medium, where man coverage dominates. Share of five-plus-man rushes on third down played with zone coverage, by yards to go, NFL regular seasons 2023–2025 pooled. The n at the foot of each bar is the number of plays in that group. The charters’ man/zone labels shift between seasons, so the levels are rough, but the pattern (lowest at 4–6 yards, highest at 11-plus) holds in each season. Source: nflverse participation and FTN charting data.

Read it with the “count to eleven” table in mind. On third-and-1 to 3, only 27% of blitzes came with zone behind them; on third-and-11 or more, 47%. Man was most dominant of all at 4 to 6 yards (zone on only 20%), the distance a quick throw against an

¹⁶Course calculation from nflverse play-by-play and FTN charting, regular seasons: Minnesota 2023 rushed five or more on 50.5% of charted dropbacks (league high); 2024 four-man rushes with at least one FTN “blitzer,” Minnesota 11.3% (rank 2), Tampa Bay 12.1% (rank 1). Chiefs 2023: 6.8% (rank 6), 57 sacks. Note that the proxy ranks the 2023 Ravens only 13th, which is one reason not to treat it as a complete count of simulated pressure.

¹⁷Beatson, “Brian Flores: The Bogeyman” (cited in full in the note on Nguyen’s definition): through Week 8 of 2024, pressure rate 35% (6th) with four or fewer rushers and 34% (27th) with five or more; blitz rate 40% in 2024 against 52% in 2023 by SIS’s charting.

underneath zone converts most easily.¹⁸ That is the fire zone's bargain showing up in the data: three underneath defenders are a fine trade when the offense needs 12 yards and a poor one when it needs two. (Simulated pressure, which keeps four underneath, is less tied to distance.) Third downs get their own chapter in Third Down: The Money Down.

Watch for it on Sunday

💡 Watch for it

Before the snap: read the pressure look.

- **Count the players at or near the line.** Six or more means a pressure look. Is it two linebackers mugging the A gaps, a safety walked down beside an end, a nickel creeping toward the slot?
- **Count the deep players.** Two safeties deep and the corners off means at most five rushers in any sound call, and probably four. One deep safety leaves room for a fire zone or a Cover 1 blitz; none, with corners pressed, warns of Cover 0.
- **Find who *could* drop.** Stand-up edge players and any lineman in a two-point stance are the likely droppers; a lineman with his hand down, weight forward, is probably rushing.
- **Watch the offense react.** A center pointing and re-pointing, a back moving to the other side, a tight end staying in: the offense is changing its protection to answer what it sees.

After the snap: who dropped?

- **Find the lineman who dropped into coverage,** and then find who replaced him as a rusher. That pair is the zone blitz. The broadcast's high replay angle shows it best.
- **Count the rushers.** Five with three deep is a fire zone; four, with one of them a linebacker or defensive back and a lineman in coverage, is a simulated pressure; five or six with man coverage is an ordinary blitz.
- **Follow the ball.** Did the quarterback throw hot? Was a dropper in the lane? If the quarterback completed it, where was the hole: behind the dropper, over a dropping tackle, or the receiver a blitzing corner left?
- **Find the blocker who blocked nobody.** On a sim pressure there is usually one: a center or tackle standing with his hands up and no one in front of him. He is the measure of how well the lie worked.

For your log: on every third-and-6-or-more for one quarter, write down the number at the line before the snap, the number who rushed, and whether a lineman dropped. A defense whose two numbers often differ is a sim defense.

¹⁸Course calculation from nflverse participation (`defense_man_zone_type`) and FTN charting, 2023–2025 regular seasons, third-down dropbacks with five or more rushers and a man or zone label. By season, the zone share at 3rd-and-11+ was 43%, 32%, 64% and at 3rd-and-4 to 6 22%, 16%, 22% (2023, 2024, 2025).

Predict the play

💡 Predict the play 1: six at the line, two deep

Figure 8: Third-and-9. The offense is in the 2x2 shotgun with the back beside the quarterback. The defense shows six at the line (four linemen, the Mike and Will mugging the two A gaps; both ringed) with the nickel over H. Behind them: two safeties 13 yards deep and both corners 8 yards off their receivers.

How many will rush, who is most likely to drop, and what should the quarterback be careful about?

Answer 1 is at the end of the chapter. Try it first.

💡 Predict the play 2: 0.7 seconds after the snap

Figure 9: Second-and-10. The picture is 0.7 seconds after the snap; the dashed outlines show where the defenders started. The 3-technique tackle (purple ring) has turned and is dropping. The Will (red ring) is rushing through the B gap. One safety is in the middle of the field and the corners are bailing.

What is this, what is probably behind it, and where should the ball go?

Answer 2 is at the end of the chapter. Try it first.

💡 Predict the play 3: third-and-2

Figure 10: Third-and-2 near midfield. Six defenders at or near the line, one safety deep in the middle, and both corners pressed on the outside receivers, a yard off and square to them. The nickel is up tight on the slot.

If this is a blitz, will the coverage behind it be zone (a fire zone) or man? And what's the offense's answer?

Answer 3 is at the end of the chapter. Try it first.

Checklist so far (Parts 1–7)

Part 7 ends here, so the card grows again. The new lines are the **pressure tells**: how many are at the line, who could drop, how many are deep, and, after the snap, how many came, who dropped and who replaced him. Read them right after the shell: the shell tells you how many defenders are committed to the deep part of the field, and so how many the defense has left to rush.

Watching checklist • after Part 7		new in Part 7
BEFORE THE SNAP		
1	Situation: down, distance, field zone, clock and score	Part 1
2	Personnel: who is on the field for each side	02-01, 02-05
3	Formation and strength: 2x2, 3x1, where is the tight end?	02-02 to 02-04
4	Motion: does a defender travel (man), bump (zone) or spin a safety?	02-06
5	Box count: blockers against defenders near the line	02-05, 05-05
6	Shell: one-high or two-high? Depth and width of each safety	06-01, 06-06
7	Corners: technique says man or zone; leverage says where the help is	06-01 to 06-06
8	Pressure look: how many at or near the line? A-gap mugs, a safety or nickel walked up?	07-02, 07-03
9	Who could drop, who could rush? Count the deep players: they cap the rush	07-03
10	Protection: where is the back, which way will they slide, who is hot? Where is the best rusher, and the help?	04-02, 07-01
AT THE SNAP		
11	Run or pass: the offensive linemen's first step	Parts 3–4
12	Rotation: did a safety move during the cadence, at the snap, or not at all?	06-06
13	Count the rushers: three, four, five or more? Who dropped, and who replaced him?	07-02, 07-03
ONE SECOND AFTER		
14	Middle of the field: closed (1 deep) or open (2)? Then the corners: squat, bail or trail	06-01 to 06-06
15	Trips? Backside safety: home, poach, rotate or solo?	06-06
16	Pressure: stopwatch from snap to pressure. Did the ball go hot, and into a dropper?	07-01, 07-03
17	Log it: your pre-snap call against what it became; at the line vs rushed	06-06, 07-03

Figure 11: The watching checklist after seven parts of the book. Earlier lines come from Parts 1–6; the highlighted lines are new in Part 7: the pressure look and who could drop or rush before the snap, the protection the offense chooses in answer, and after the snap the rusher count, the dropper and his replacement, and the stopwatch on the pressure. The card becomes the master checklist of the capstone.

Takeaways

- **A blitz trades coverage for pressure; the zone blitz tries not to.** It rushes a defender the protection didn't count and drops one it did (a lineman, the *dropper*), so the rush is confusing and the coverage behind it is still zone.

- **The fire zone is the standard form:** five rush, three under, three deep. It refuses to give up the deep ball and accepts short throws in its place. Its holes live next to the slowest dropper (behind a dropping end, over a dropping tackle, or where a blitzing corner was), and they move with each variant.
- **Protections lose to rules, not people.** The Mike call, the slide and the back's assignment are predictions made from where defenders stand. A pressure look gets the offense to commit; the zone blitz brings rushers from wherever it didn't commit, and drops a man into the hot throw's lane.
- **Simulated pressure (the creeper) does it with four.** Four rushers from unexpected places, seven in coverage: it wins one-on-ones and makes blockers block air without paying in coverage. In 2023–2025 charting it produced blitz-like pressure and sack rates with four-man-rush coverage behind it.
- **It only works if the blitz is real.** Creepers fool offenses that must respect a blitz, so the best sim defenses (Macdonald's Ravens and Seahawks, Flores's Vikings) also show, and sometimes bring, everything.
- **Count to eleven.** Rushers plus underneath plus deep equals eleven. Count the deep players before the snap to cap the rush, and count the rushers after it to name what you saw.

Connections

Builds on: Blitzing (blitz math, man pressure and mugs, the costs this chapter's schemes try to avoid), Pass Protection (the slide, the Mike call, check-release and the hot throw, all of which a zone blitz attacks), Cover 3 (the three-deep structure and the seam-flat defender behind every fire zone), The Pass Rush (rush lanes and stunts) and Disguise, Rotation, and Split-Field Coverage (show one thing, play another, now applied to the rush).

Sets up: Concepts Versus Coverages, where the quarterback's side of the read (blitz-beaters and zone-blitz beaters) is built; Third Down: The Money Down, where these calls live; and 1978 and the Passing Revolution, which places the zone blitz in the arms race that the passing rules of 1978 started.

Case study: Fangio's Two-High Revolution and Macdonald's Answer follows simulated pressure into the modern two-high era, from Macdonald's Ravens to his Super Bowl champion Seahawks.

Answers to Predict the play

Answer 1.

Most likely four or five, not six, and at least one of the mugged linebackers will drop. Count to eleven. Two deep safeties and two off corners are four defenders who are, before the snap, playing deep or soft. That leaves seven near the line, and a defense that sent six of them would have one man underneath and soft corners: a Cover 0 blitz without the press coverage Cover 0 needs. So the likely calls are a **simulated pressure** (four rush, perhaps one mugger and three linemen, with one end or tackle dropping and quarters or Cover 2 behind) or a **fire zone** with a safety rotating down (five rush, three under, three deep).

The likely droppers are one of the two mugged linebackers (they can't both rush and leave the middle empty in either call) and probably one end, who replaces the linebacker in a hook zone.

The quarterback's danger is the hot throw. With two deep safeties and the mugs, a dropper is very likely to land in the short middle, right where the slant against a linebacker blitz wants to go. His better answers are throws outside the droppers: quick hitches or outs against corners playing 8 yards off, or a route that sits in the hole a dropping lineman leaves behind him. If the offense has time to check, keeping the back in and sliding toward the mugs means the worst case is a four-man rush against six blockers, which is a fine trade on third-and-9.

Answer 2.

A simulated pressure: four rush (the Will and three linemen), and a tackle drops. Count the rushers: the left end, the 1-technique, the right end and the Will, four in all, with one of them a linebacker and one of the linemen going the other way. With the middle of the field closed and the corners bailing, the coverage behind it is most likely **Cover 3**: three deep, four under, with the dropping tackle as one of the underneath players, walling off the short middle around 4 to 6 yards.

Throw away from the dropper, and over him. A tackle can't get much deeper than 5 or 6 yards before the throw, so the window *behind* him, an in-cut at 10 to 14 yards on the right side, is open, and so are the classic Cover 3 holes on the far side. What the quarterback shouldn't do is what the defense wants: see a linebacker blitz and throw the quick slant inside, straight into the 300-pound man in the lane.

Answer 3.

Man, most likely a Cover 1 blitz. Two reasons. *The situation*: on third-and-short a fire zone gives up exactly what the offense needs, a short throw in front of three underneath defenders, so defenses that blitz on third-and-1 to 3 play man behind it about three times in four (the third-down chart above). *The picture*: corners pressed and square, and a nickel tight on the slot, are man techniques (Disguise, Rotation, and Split-Field Coverage), and one deep safety is the Cover 1 shell.

The answer is the man-beater: quick throws that win against tight man coverage, such as a slant, a rub or pick concept where two receivers cross, or a back-shoulder fade, timed to come out before the extra rusher arrives, with the protection set to leave the free man (if there is one) on the side away from the throw. Of course a smart defense knows the offense expects man here, which is when a simulated pressure with zone behind it becomes a surprise worth calling. That is the game the next part of the book plays.
