

Third Down: The Money Down

The down that decides drives: how far the offense has to go changes everything both sides do, from the routes and the personnel to how many rush, who covers, and who just watches the quarterback.

Third-and-7, early in the fourth quarter, a three-point game. You can tell it matters before anyone lines up. The broadcast puts up a graphic of the offense's third-down conversions so far. On the defensive sideline, two linebackers jog off and two defensive backs jog on, and a pass rusher who has been standing by the bench all series pulls on his helmet. The offense's best receiver, who stood out wide on first and second down, now lines up in the slot. The quarterback looks to the sideline, then points at a safety and shouts. At the snap, five defenders rush, the slot receiver pushes eight yards upfield, looks at the defender in front of him and turns *away* from him toward the sideline, and the ball is already there. The chains move. Why did half the defense change before the play? Why eight yards, not seven, and why did the receiver seem to decide where to go after he started running? And why does the whole stadium seem to agree that this one snap is worth more than the two before it? This chapter is about **third down**, the down that decides drives, and about why everyone on the field plays it differently.

You'll be able to...

- Bucket a third down (short, medium, long or very long) and say roughly how often each is converted, by a run and by a pass.
- Predict, before the snap, whether the throw will go past the line to gain, and explain when a throw short of it is the right call anyway.
- Name the offense's third-down tools (sticks routes, option routes and other man-beaters, and the screens and draws of third-and-long) and say which distance each is for.
- Recognise a defense's third-down package by its personnel, then name the call it is most likely to play: sticks defense, simulated pressure, a blitz, Cover 0, rush three/drop eight, or a spy.
- Read a conversion chart by distance and play type, and explain why the money down is not quite as predictable as it feels.

i You'll need

This chapter sits on the situation work of Early Downs and Field Zones and on the pressure chapters, and it borrows a little from almost every part before it. One line each:

- **Downs and the chains** (Downs, Distance, and Field Position): the offense has four downs to reach the line to gain, 10 yards from where the series started, marked on the sideline by the sticks. Fail on third down and the usual choice is a punt. EPA scores a play by how much it changed the expected points of the drive; success rate counts a play as a success when it gains enough to stay on track, and on third down that means converting.
- **Early downs** (Early Downs and Field Zones): an offense is on schedule when first and second down leave a short third down, behind schedule when they leave a long one. Near midfield, in four-down territory, the offense may plan to go for it on fourth down, which changes what third down is for.
- **Packages** (A First Look at Defense): nickel is five defensive backs, dime six, and a quarter package seven.
- **Man coverage** (Man Coverage): Cover 1 is man coverage with one deep safety, often with a robber sitting in the middle to jump in-breaking routes; Cover 0 is man with nobody deep.
- **Pressure** (Blitzing, Zone Blitzes, Fire Zones, and Simulated Pressure): a blitz sends five or more rushers; a Cover 0 blitz sends six or more with nobody deep. A simulated pressure rushes four from unexpected places, and a fire zone rushes five with zone coverage behind. Linebackers standing in both gaps beside the center are a double A-gap mug. When rushers outnumber blockers the quarterback throws hot.
- **Routes and concepts** (Passing Game Fundamentals, Dropback Concepts): on an option route the receiver chooses his break after the snap from his defender's position. A man-beater is a concept built to beat man coverage, such as mesh (two shallow crossers that brush past each other) or a rub route, which uses one receiver to get in the way of another's defender. Air yards are how far past the line of scrimmage the ball travels in the air; YAC is what the receiver adds after the catch.
- **Third-and-long runs and screens** (Gap Schemes, Play-Action, Bootlegs, and Screens): a draw play shows pass, then hands off; a screen lets the rush through and throws behind it to a receiver with blockers in front.
- **The quarterback on the move** (Quarterback Play, The Pass Rush): when nobody is open he throws a short checkdown or scrambles. Pass rushers stay in rush lanes and the ends keep contain so he can't escape outside.

How to read the diagrams. Offense is blue circles: the linemen (only the center, C, is labelled on wide pictures), Q the quarterback, R the running back, X and Z the outside receivers, H the slot receiver and Y the tight end. Defense is outlined orange squares: E and T the defensive ends and tackles, N a nose tackle, B a stand-up edge player, M the Mike and W the Will linebacker, \$ the nickel back (the slot cornerback), D a dime back (the sixth defensive back), CB the cornerbacks, FS and SS the free and strong safety. A **green ring** marks the player to watch and a **purple ring** a spy. Blue arrows are routes, the thick dark-blue arrow a ball carrier's path; solid orange arrows are rushers and dashed orange arrows zone drops, with the shaded ovals the zones; dotted orange lines join a man-coverage defender to his receiver. The thick orange line across the field is the **line to gain**, the blue line the line of scrimmage, and the small numbers on the left edge count yards past the line of scrimmage. Left and right are the offense's.

Why third down is the money down

Start with what third down *is*. On first and second down a bad play is a setback; on third down it is usually the end of the drive. Convert, and the offense gets three more tries and keeps the ball. Fail, and outside field-goal range it punts, giving the ball away 40 yards downfield. That cliff is why the down gets its nickname.

Put a number on the cliff. In the 2021–2025 regular seasons, a converted third down was worth +1.8 expected points to the offense on average, and a failed one –1.3. The difference, about **3.0 points**, rides on one snap.¹ No other ordinary play swings that much so often: a first-and-10 that gains four yards or loses one leaves the drive alive either way. Third downs are only about 21% of all runs and passes, but they decide whether most drives become points or punts.

And the league converts them at a remarkably steady rate: between 39% and 42% in every season from 2016 to 2025, about two in five.² Rule changes, the passing boom and the two-high defenses of the last decade have barely moved it. That stability is a clue.

¹Course calculation from nflverse play-by-play, 2021–2025 regular seasons, every third-down run and pass (kneel-downs and spikes excluded): average EPA of plays that reached the line to gain or scored, against those that didn't. Plays wiped out by penalties are not included. The swing is larger in the middle of the field and smaller near either goal line.

²Course calculation from nflverse play-by-play, regular seasons 2016–2025, every third-down run and pass (kneel-downs and spikes excluded); a conversion is a play that gained the line to gain or on which the offense scored (`third_down_converted`, or a touchdown by the offense; a turnover returned for a touchdown is a failure). First downs by penalty are not counted, which is why published rates that include them run slightly higher. The highest season was 2020.

Third down is a contest both sides prepare for more than any other, and the offense's gains and the defense's answers have stayed roughly matched.

What makes third down special isn't just the stakes; it's the **information**. On first-and-10 the defense has to guard against everything, because the offense can do anything. On third-and-8 both sides know what the offense needs: eight yards, almost certainly through the air. Knowing that, the defense can specialise. It can take off run defenders and put on pass defenders, take off a big run-stopping tackle and put on a quick pass rusher, and set every underneath defender's depth by the line to gain. The offense specialises too: its best receiver moves to where he can get a free release, its routes are cut to a depth measured from the sticks, and it calls the plays it has practised all week for exactly this distance. Third down is the down on which the situation tells both teams the most, so it is the down on which they each carry a separate plan.

i Madden vs. real life

In a video game you pick a play from a menu on every down, and the menu looks the same on third-and-8 as on first-and-10. In the NFL, third down has its own section of the call sheet, its own practice day (in a typical week the third-down plan is installed on Thursday, after the early-down plan; The Game Plan), its own personnel and often its own play-caller's mindset. The plays on that page are sorted by distance: third-and-1, third-and-2 to 3, third-and-4 to 6, third-and-7 to 10, third-and-long. A coordinator calling a third-down play is choosing from a short list built for exactly this distance against exactly this opponent's third-down habits, not from the whole playbook.

Four kinds of third down

A broadcaster will tell you "third and short" or "third and long." Coaches cut it finer, because each distance changes what both sides can do. This book uses four buckets:

- **Short: 1 to 3 yards.** A run can get it, so the offense's whole menu is open, and the defense has to defend both.
- **Medium: 4 to 6 yards.** A run *can* get it but usually won't; this is the home of the quick passing game and of the man-coverage contest.
- **Long: 7 to 10 yards.** Almost always a pass, and a pass that has to travel past the defenders who are waiting at the sticks. This is where pressure peaks.
- **Very long: 11 or more.** The offense's odds are poor and both sides know it. The defense can play safe, and the offense sometimes chooses to play for field position instead of the first down.

Figure 1: Third-down conversion rate by yards to go and by play type, NFL regular seasons 2021–2025. Designed runs convert more often at 1 and 2 yards to go; from 4 yards on, dropbacks (passes, sacks and scrambles together) convert far more often, and a run on third-and-11 or more almost never does. The small number under each bar is the number of plays (k = thousand); runs are rare from 4 yards on, so those bars are mostly deliberate, low-risk calls. Source: nflverse play-by-play.

Read the chart as two price lists laid on top of each other.³ On **third-and-1**, runs convert 73% of the time and dropbacks 59%. That isn't because passing is worse; it's because a run needs only a yard and gets it on a good push, while a pass can go wrong in more ways (a sack, a drop, an incompleteness) that a run can't. By **third-and-3** the two are level, and from **4 yards** on the pass is the only sensible way: runs on third-and-4 to 6 convert 36%, dropbacks 45%. Offenses know it, which is why they pass on 91% of third-and-4 to 6 snaps and 94% of third-and-7 to 10.

Taken together, the buckets are steep. Short third downs were converted 60% of the time across 2021–2025, medium ones 44%, long ones 31% and very long ones 15%. And the long kinds are common: 46% of third downs needed 7 yards or more. That is why coaches care so much about first and second down: a four-yard gain on first down doesn't look like much, but it is the difference between a third down in the top half of this chart and one in the bottom half (Early Downs and Field Zones).

Each bucket has its own logic, and the rest of the chapter follows it.

Short (1–3). The defense must respect the run, so it can't fill the field with defensive backs. It usually plays man coverage, tight, because any completion converts, and it often packs the box. The offense's best weapons are a power run, a quarterback sneak, or a quick throw that beats tight man coverage before the rush arrives. Third-and-1 near the goal line and the sneak get their own chapter, Red Zone, Goal Line, Two-Point Plays, and Short Yardage.

Medium (4–6). The most contested distance. The offense will almost certainly throw, but it doesn't need to throw far: a 6-yard route run well converts. The defense knows it, so it plays tight man coverage and blitzes to force the ball out before those routes are finished. It is the bucket of option routes, rubs and mesh on one side, and of Cover 1, Cover 0 and A-gap mugs on the other.

Long (7–10). Now the offense needs a route that takes time to run, and that time is what the defense attacks. Blitzes peak here, and so do simulated pressures, because a hot throw to beat them usually lands short of the sticks.

Very long (11+). The defense can concede anything short and still win. It drops more players into coverage, plays deep, and rallies to tackle. Some offenses take a shot; many take the safe completion, the screen or the draw, and play for a better punt or a field-goal try.

The sticks route: a yard past the line

If the target is a known distance, aim past it. That is the whole idea behind a **sticks route**: a route whose depth is set by the line to gain, usually so the receiver breaks or settles a yard or two beyond it. On first-and-10 a curl might be run at 12 yards because that's where it fits the defense. On third-and-6 the same receiver runs it at 7 or 8, because what matters now is that the catch is a first down *at the catch*, with no need for yards after it. Coaches teach it bluntly: get past the sticks before you break, and don't break short of them.

Why a yard or two past, and not exactly on the line? Three reasons, and all three are about the catch point.

1. **Receivers drift back toward the ball.** A receiver who breaks at 7 and turns back to the quarterback is caught at 6 and a half, short of a third-and-7. A route designed at 8 leaves room for that.
2. **Defenders sit on the sticks.** On third down the underneath defenders' landmark *is* the line to gain (more below). A ball caught right on the line is caught in front of a defender who is already there and only has to tackle forward.
3. **The spot is generous only one way.** The official spots the ball where the receiver's forward progress stopped. A receiver who catches the ball a yard past the line can be driven backward and still get the spot past it; one who catches it on the line needs every inch.

But a sticks route can't go *too* far past the line, because every extra yard of depth costs completion probability: it takes the receiver longer to get there, and the quarterback has to hold the ball against the rush. The design problem of third-and-medium is to get a receiver open as close past the sticks as possible, as fast as possible. Against the man coverage defenses favour at those distances, that means beating a defender who knows where you're going.

The answer to man: routes that choose

Here is a typical third-and-7 against Cover 1. The offense is in trips to the right; the defense plays man coverage with one deep safety and a robber.

³Same data and definitions as the season rates, 2021–2025 regular seasons. Dropbacks are nflverse `qb_dropback` plays: pass attempts, sacks and scrambles. Pass shares are the share of third-down snaps at each distance that were dropbacks.

Figure 2: Third-and-7 against Cover 1 (illustrative). The offense is in trips to the right: Z (#1), H (#2) and the tight end Y (#3, attached to the line), with X alone on the left. The defense plays man coverage (dotted lines) with the free safety (FS) deep and the strong safety (SS) as a robber in the middle. Z and X run go routes that take their cornerbacks deep, and Y's seam holds the free safety in the middle. H runs an option route set past the line to gain: he pushes to 8 yards, reads the nickel (\$), who is lined up inside him, and breaks away from that leverage, toward the sideline, where the robber can't help. The ball is out at about 1.6 seconds. The back checks for a blitz, then releases to the flat as the checkdown.

The option route is the heart of it (Passing Game Fundamentals taught the rule). A man defender has to line up on one side of his receiver, and the side he picks is the side he is protecting. Here the nickel sits inside H, taking away the quickest throws, the slant and the in-cut toward the middle. So H pushes to 8 yards, past the line, and breaks the other way, toward the sideline, where the nickel can't get to him in time and the robber can't help. Had the nickel lined up outside instead, trusting the robber to cover the middle, the rule would send H inside, straight toward that robber, and the quarterback would have to see it and look elsewhere. That is why the quarterback reads two things on this play, not one: the nickel's leverage and where the robber is standing. The receiver doesn't guess; he reads, and the quarterback reads with him, which is why option routes go to the receivers a quarterback trusts most.

The rest of the concept exists to protect that one decision. The two go routes outside are *clear-outs*: they take the cornerbacks, who are in man coverage and must run with them, out of the area where H will break. Y's seam up the middle gives the single deep safety something to worry about, so he can't drift toward the sideline to help on H. And the back is the checkdown. If the defense blitzes, he blocks; if it doesn't, he is the safe throw, short of the sticks, for when the option route is covered.

The option route is one of a family of third-down man-beaters, all of which do the same job by different means: give the receiver an advantage over a defender who has no help.

- **Rubs and bunches.** Line receivers up close together, a bunch, and send them across each other's paths. Each man defender has to fight through traffic to follow his receiver, while zone defenders would just swap receivers. (Dropback Concepts draws the concepts; where a rub becomes illegal offensive pass interference is in Contact Rules and Penalties as Strategy.)
- **Mesh.** Two shallow crossers who brush past each other in the middle, with the same traffic problem for their defenders; the crossers usually settle a few yards past a third-and-medium line to gain.
- **Slants and quick outs.** The fastest throws on the field, aimed at the receiver who has the leverage he wants before the snap. They beat a blitz too, because the ball is out before the rush arrives.
- **Matchups.** The offense moves its best receiver to wherever the defense's worst cover man will have to take him, usually the slot, against a linebacker or a safety. On third down, *who* covers whom often matters more than the concept.

Why does all this aim at man coverage? Because that is what defenses play on third-and-short and medium. In 2023–2025, charted third-down dropbacks at 1 to 3 yards to go were played in man coverage 58% of the time, and at 4 to 6 yards 58%; at 11 or more

it fell to 26%.⁴ A zone defense on third-and-4 has defenders spread across the field waiting for the ball, and any route that finds the space between two of them, five yards deep, converts. Man coverage takes that space away by putting a defender on every receiver. The offense's reply is to make that defender's life as hard as possible for about a second and a half.

! Why it exists

The sticks route exists because on third down the *distance is fixed in advance*. Every other down rewards yards in general; third down rewards one specific yard, the one past the line to gain, and nothing else. So the offense sets its routes by that yard, a little past it, and gives the receiver the right to choose his break, because against man coverage the defender's alignment tells him which way is open. **What it gives up:** a route set to the sticks is a short route, so it hands the defense a target depth too. Sit defenders at that depth, as zone teams do on third-and-long, and the sticks route runs straight into them.

Past the sticks: what the numbers say, and when it doesn't matter

Every broadcaster has said it: "you have to throw it past the sticks on third down." Here is how true that is.

Figure 3: Where third-down passes were aimed, and what happened. Each bar is the share of attempts that converted, grouped by how far past (or short of) the line to gain the ball was thrown (air yards minus yards to go); the line is the completion rate for the same throws. Throws short of the line are caught more often but convert rarely, because the receiver still has to run for the rest; throws one or two yards past it convert most often; deeper throws are completed, and so convert, less often. Third-down aimed passes (sacks, scrambles and throwaways without a charted depth excluded), NFL regular seasons 2021–2025. Source: nflverse play-by-play.

The shape of the bars is the case for the sticks route.⁵ Throws aimed 10 or more yards short of the line to gain were completed 77% of the time and converted only 9%. Throws aimed one or two yards past it converted 63%, the best of any group. Past the line, the bar and the line meet: every completion there converts, so conversion simply tracks completion rate, and falls as the throws get deeper and harder to complete. Notice the dip for throws aimed right *at* the line (52%, with completions falling off too): that is very likely, at least in part, the sticks-sitting defender at work, and it is the reason the sticks route is set a yard or two beyond.

So the broadcasters are mostly right. But “past the sticks” is a rule about *averages*, and there are four situations in which a throw short of the line is the right one.

1. **Third-and-short.** Even a catch behind the line can convert when the line is only a yard or two away. Completed throws short of the sticks converted 80% of the time on third-and-1 and 69% on third-and-2, against 36% on third-and-7 to 10 and 11% on 11

⁴Course calculation from nflverse `load_participation()` (FTN charting), 2023–2025 regular seasons, third-down dropbacks; man share among plays charted `MAN_COVERAGE` or `ZONE_COVERAGE`. The charters' man/zone split shifts from season to season, so treat the levels as rough and the pattern by distance as the finding.

⁵Course calculation from nflverse play-by-play, 2021–2025 regular seasons: third-down pass attempts with a recorded `air_yards` (sacks and scrambles excluded; throwaways usually have no charted depth). “At it” means air yards equal to the yards to go. Air yards are measured to where the ball was caught or would have been, not to where the receiver was tackled.

or more. On third-and-1 a pass to the flat, caught a yard *behind* the line with nobody near the receiver, is a good play; it's a run with a better start.

2. **The receiver who will run after the catch.** Screens and quick throws to the offense's best open-field runner are short by design: the bet is on the yards after the catch, and against a defense playing deep it can be a good bet.
3. **Four-down territory.** When an offense near midfield has already decided it will go for it on fourth down if it needs to, third-and-6 is really "third-and-6 with two tries." A five-yard completion that sets up fourth-and-1 is then a fine outcome (Early Downs and Field Zones has the field zones; The Clock, the Two-Minute Drill, and Fourth Down the decision).
4. **Field-goal range and field position.** On third-and-12 at the opponent's 35, a 7-yard completion doesn't convert, but it turns a 52-yard field-goal try into a 45-yard one. Deep in his own end, an offense facing third-and-15 may simply want a safe gain and a punt from further out.

How often do offenses throw past the line? It depends heavily on the distance: 78% of aimed passes on third-and-1 to 3 were thrown at or past it, 68% at 4 to 6, 52% at 7 to 10 and only 29% at 11 or more. The longer the distance, the more the defense can make the deep throw hard and the short throw easy, and the more often the quarterback takes the short one.

Common misconception

"A completion short of the sticks on third down is a quarterback mistake." Sometimes. But on third-and-11 or more the defense's whole design is to make the short completion the only open one, with everybody else deep and waiting at the line to gain. A quarterback who forces the ball into that coverage risks an interception to chase a first down that converts less than one time in five even when everything goes right. Taking the checkdown, getting five yards, and punting from further out is often the better play. The mistake is the *other* one: the third-and-5 checkdown that gets four, when a receiver was open at six.

Third-and-long: screens, draws and the punt

On third-and-12 the odds are poor whatever the offense calls: dropbacks converted 16% of third-and-11-or-more snaps in 2021–2025. Here a lot of offenses stop trying to win the down outright and start trying to win the *possession*: to avoid the sack, the interception and the holding penalty, and to make the punt that follows a little shorter. Two plays do most of that work, and both turn the defense's third-and-long plan against it.

The **screen** lets the pass rush through and throws behind it. On third-and-long the defense's rushers are pinning their ears back and its coverage players are deep and facing the quarterback, so a back or receiver who catches the ball behind the line with linemen in front of him has room. The **draw** shows a pass, then hands the ball off up the middle, into the space the linebackers just left by dropping into coverage. Its mechanics, and Paul Brown's Browns who made it famous, are in Gap Schemes. Here is why it lives on third down.

Figure 4: A third-and-12 draw against a dime defense (simulated, illustrative). Snap: the defense has four rushers, one linebacker (M) and six defensive backs, two of them deep. +0.8 s: everything says pass. The quarterback has dropped, the linemen have set back as if to pass-block and let the rushers come upfield and outside, the receivers are running deep, and the defense is dropping into coverage. +1.7 s: the back takes the handoff and runs up the middle, where the Mike was standing before he bailed to 10 yards; the center releases to block him. +3.3 s: the back reaches the defensive backs at 9 to 10 yards and is tackled, short of the line to gain (orange). The draw worked as designed and still didn't convert: that is the bargain.

Watch what the defense's third-and-long plan does to itself. It has taken off a linebacker for a sixth defensive back, so there is one fewer big body near the line. Its remaining linebacker drops to 10 yards at the snap, because that is where the passing windows are. Its rushers come upfield as fast as they can, because they are trying to reach a quarterback who is about to throw. The draw uses all three: the linemen let the rushers run themselves past the play, and the back runs into the space the dropping linebacker left. Against a defense playing the pass, it's one of the few runs with numbers on its side.

And it still usually fails to convert. Designed runs on third-and-11 or more converted only 5% of the time in 2021–2025, because the defensive backs who dropped to the sticks are waiting there to tackle. So why call it? Partly because a 9-yard run on third-and-12 is a better outcome than a sack, an interception or an incompleteness, especially near midfield, where it improves the punt or sets up a long field-goal try. Partly to protect the next third down: a defense that has been gashed by a draw rushes a half-step more carefully the next time, and its linebacker drops a half-step later. That is a constraint play, a call that exists to keep the defense honest against another (Constraint Theory).

The same logic explains the third-and-long screen, which also rarely converts but pays in the same currency. Both are cheap ways to lose the down safely, with a small chance of winning it big against a defense that guessed wrong.

The defense's third-down package

When the defense knows the offense will throw, it changes the people on the field. That is a **third-down package**: the personnel and calls a team keeps for third down. On defense it means more defensive backs, faster pass rushers, and the pressures and disguises it has practised all week. On offense it means its best quick concepts, its protections for the opponent's pressures, and the receivers and back it trusts most on the money down.

The defensive half is visible from your couch, and the data show it clearly.

Figure 5: What NFL defenses did on third-down dropbacks, by yards to go, 2023–2025 regular seasons: how often they had six or more defensive backs on the field (dime or quarter personnel), blitzed (five or more rushers), played Cover 0 (man coverage with no deep safety) and rushed three or fewer. Dime grows with the distance; Cover 0 shrinks; the blitz peaks at 7 to 10 yards and falls away at 11 or more, where rushing three becomes more common. Rates are shares of charted dropbacks; Cover 0 is a share of dropbacks with a charted coverage. Source: nflverse participation data (FTN charting).

Personnel. Defenses had six or more defensive backs on the field for 11% of third-and-short dropbacks, 42% at 7 to 10 yards and 45% at 11 or more, against 8% on first and second down.⁶ The dime back replaces a linebacker: he covers better and tackles worse, and on a down when the offense is very likely to throw that is a good trade. It is also a bet, and the draw above is how the offense makes the defense pay when the bet is wrong.

Pass rushers. The same logic applies up front. A 330-pound run-stopping tackle who is excellent on first-and-10 is wasted on third-and-9, so many defenses replace him with a lighter, quicker rusher, or put four edge rushers on the field together, with two of them lined up inside over the guards. Steve Spagnuolo’s 2007 Giants had a package of four pass rushers that *Sports Illustrated* later called his “Four Aces”; by 2011 the Giants’ version, four defensive ends on third-and-long, was known as their “NASCAR” package, for its speed.⁷ Most NFL defenses now have some version of it, and many rosters carry a rusher or two who play mostly on passing downs.

Calls. Third down is also where a defense spends the calls it has been saving: its disguises, its simulated pressures, its all-out blitzes. The rest of this chapter takes the five big families in turn: sitting at the sticks, sending pressure, Cover 0, rushing three, and spying the quarterback. The chart already shows their shape. Cover 0 is a short-yardage call: 9% of charted third-and-1 to 3 dropbacks, 2% at 11 or more. The blitz peaks at 7 to 10 yards (38%) and drops off sharply after it. Rushing three is rare everywhere, and most common on the longest downs.

⁶Same data as the man-coverage shares. Defensive backs counted from `defense_personnel` (CB, S, FS, SS and DB entries); “dime or more” is six or more. Blitz is five or more `number_of_pass_rushers`; Cover 0 is a share of plays with a charted `defense_coverage_type`. Early downs are first- and second-down dropbacks in the same seasons.

⁷Jenny Vrentas, “Steve Spagnuolo: The Man With Four Aces Up His Sleeve,” *Sports Illustrated* (Dec. 27, 2016): <https://www.si.com/nfl/2016/12/27/nfl-new-york-giants-steve-spagnuolo-defensive-coordinator> (the 2007 “Four Aces” package of four pass rushers). The “NASCAR” name for the Giants’ four-defensive-end package on third-and-long: Bleacher Report, “5 Scheme Adjustments the New York Giants Should Consider in 2012” (2012): <https://bleacherreport.com/articles/1177469-5-scheme-adjustments-the-new-york-giants-should-consider-in-2012> ; Justin Tuck after Super Bowl XLVI: “We came up with NASCAR; we call it our speed package” (to ESPN, quoted by Jayski, Feb. 7, 2012: <https://www.jayski.com/2012/02/07/nascar-propels-giants-to-super-bowl-victory/>). The SI piece names no players for the 2007 package, so neither does the text; *Dynasties and Counterpunches* has the 2007 ends.

The offensive half of the package has faces too. Under Bill Belichick and Josh McDaniels the Patriots kept a running back whose main job was third down: catching passes, picking up blitzers, and running the option routes out of the backfield that linebackers struggle to cover. James White was New England's most-targeted receiver on third down in both 2018 and 2019, the target on 26% of Tom Brady's third-down throws to a named receiver across the two seasons.⁸ **What to notice:** on third down, watch which back comes into the game. If it isn't the starter, the substitution is a statement: protection and routes, not runs.

Sticks defense: keep it in front

The simplest third-down defense is the one that makes the offense's own target its landmark. If the offense needs 12 yards, the defense can give up 11. Coaches call it playing the sticks: zone defenders drop to (or just past) the line to gain, keep every receiver in front of them, and tackle the catch short of it.

Figure 6: The same Cover 3 at two distances (illustrative). Left, third-and-4: the four underneath defenders squeeze to about 6 yards, close enough to break on a quick throw and tackle short of the line to gain, and the deep defenders play tighter. Right, third-and-12: the same four sink to 12 or 13 yards, right on the line to gain (orange), and the cornerbacks and free safety play deeper, because nothing short of 12 yards hurts. The shaded ovals are the zones; the numbers on the left edge count yards past the line of scrimmage.

Why does this work? Because the offense's routes have to be *finished* to be useful. A curl at 14 yards takes about two seconds to run; a defender who starts at 12 and only has to take one step and tackle has almost no ground to cover. And the defense doesn't need to stop the catch, only the extra yard. This is the reason for the dip in the past-the-sticks chart at throws aimed right at the line: the defender who is standing on the line to gain catches the receiver there.

What does it give up? **Everything short.** A sticks defense on third-and-12 hands the offense an open 6-yard route on almost every snap, which is fine until the offense is in four-down territory and happy to take it, or has a receiver who can make a man miss. It also gives the quarterback time, because the underneath defenders are reading him rather than rushing him, and it asks for good tackling: a defense that misses the first tackle at the sticks has turned a stop into a first down. The cure for the first problem is pressure; for the second, a fast defense; for the third, there is no scheme.

Pressure on third down: simulated pressure and the blitz

The second family is pressure. Zone Blitzes, Fire Zones, and Simulated Pressure built the tools; here is why third down is where they live.

⁸Course calculation from nflverse play-by-play, 2018–2019 regular seasons: third-down pass attempts by New England with a named receiver (sacks and scrambles excluded). White led the Patriots in third-down targets in both seasons.

On third down the quarterback has to hold the ball until a route past the sticks is open, so every fraction of a second the defense takes away is worth more than on any other down. Pressure that forces the ball out early forces it out *short*, usually to a hot receiver in front of the line to gain, and on third-and-8 a hot throw that gains five is a defensive win.

That is why the blitz peaks at **third-and-7 to 10**. In 2023–2025 defenses sent five or more rushers on 38% of third-and-7 to 10 dropbacks, against 25% on first and second down. At that distance the hot throw is short of the sticks, so the defense can live with it; the routes that convert take time to develop, so pressure can kill them. At **11 or more** the blitz rate falls to 17%: the defense doesn't need to force the ball out, because a short throw already loses. At **4 to 6**, blitzing is more dangerous, because the hot throw can convert, so most defenses that blitz there play man coverage behind it, not zone (the third-down chart in Zone Blitzes, Fire Zones, and Simulated Pressure counts it).

Simulated pressure fits third down even better. A creeper shows a blitz, gets the protection to commit and the quarterback to plan a hot throw, then rushes four from unexpected places and drops seven, often with a lineman sitting in exactly the short window the hot throw was aimed at. On third-and-long the quarterback who throws hot into that window gains nothing, and the one who waits for a route past the sticks is facing a rusher his protection didn't count.

i Film room: Chiefs 2024 — Spagnuolo saves it for third down

Steve Spagnuolo, the Chiefs' defensive coordinator since 2019 (and still in 2026), is the clearest modern case of a coordinator whose pressure is *situational*. In 2024 the Chiefs sent five or more rushers on 32% of first- and second-down dropbacks, already above the league's typical rate (median 23%); on third down it was 42%, the second-highest rate in the NFL (league median 28%). In 2025 the pattern held: 32% early, 37% on third down. The 2025 Chiefs also played Cover 0 on 11.2% of their charted third-down dropbacks, the most in the league.⁹ The two calls go together: the all-out blitz with no deep safety, kept for the down when a quick throw short of the line doesn't hurt.

What to notice: on a Chiefs third down, count the defenders within five yards of the line before the snap, then count again after it. Spagnuolo's famous calls are the six-man zeros (Blitzing breaks down the ones from Super Bowl LVIII), but most of his third downs show that look and bring four or five.

And the honest footnote: pressure is a bet, not a guarantee. The 2024 Chiefs allowed third-down conversions on 43% of opponents' third downs, only the 24th-best rate in the league, in a 15–2 season. A blitz that gets home ends the drive; one that doesn't leaves a receiver alone.

Cover 0: all in

The most aggressive third-down call is **Cover 0**: man coverage on every eligible receiver, nobody deep, and everyone else rushing. Man Coverage and Blitzing drew it; this section is about *when*.

It is above all a **short-yardage** call. On third-and-1 to 3, Cover 0 was played on 9% of charted dropbacks in 2023–2025; on third-and-11 or more, 2%. Why short? Three reasons that point the same way.

1. **The cost of a missed tackle is lower.** With nobody deep, any completion that beats its defender can go a long way. On third-and-2 the defense will lose the down on most completions anyway, so the extra risk buys less damage than on third-and-10, where a short completion is a stop.
2. **Every defender is close to the line, which helps against the run.** On third-and-short the offense might run; Cover 0 puts eight or nine defenders within a few yards of the ball.
3. **It forces the decision now.** A quarterback facing six rushers and no safety has a second or so. He must throw hot, against tight man coverage, before the route has developed. On third-and-2 that can still convert, so the offense's answer is a quick man-beater, but on third-and-6 the routes fast enough to beat the rush are mostly short of the line.

What it gives up is everything behind it. A Cover 0 blitz that doesn't get home is one broken tackle away from a touchdown, and offenses that see it coming (both safeties walking down, corners pressed, linebackers mugged in the A gaps) answer with slants, rubs, and protection that keeps an extra blocker in.

⁹Course calculation from nflverse `load_participation()`, regular seasons: share of dropbacks with five or more `number_of_pass_rushers`, by down; Kansas City's third-down rank among 32 defenses. 2020 for comparison: 36% early, 46% on third down (rank 4). Cover 0 share of charted third-down dropbacks, 2025: Kansas City first (rank 1). Third-down conversion rate allowed from play-by-play (runs and passes, conversions as defined above). Spagnuolo as Chiefs defensive coordinator since 2019 and in 2026: this book's fact sheet of 2026 staffs. The 2024 Chiefs' 15–2 record: Pro Football Reference, <https://www.pro-football-reference.com/teams/kan/2024.htm>

i Film room: Dolphins 2021 — Brian Flores’s third-down zeros

Brian Flores spent fifteen seasons in Bill Belichick’s New England organisation (four in scouting, then eleven on the coaching staff) before becoming Miami’s head coach (2019–2021), and his Dolphins played Cover 0 more than anyone. In 2020 they played it on 17% of charted third-down dropbacks, level with Belichick’s Patriots (17%) at the top of the league; in 2021 on 28%, the most in the NFL and more than four times the league median (7%).¹⁰

The signature night came on Thursday, November 11, 2021, when the 2–7 Dolphins beat the 6–2 Ravens 22–10 in Miami. Flores sent five or more rushers on 52% of Lamar Jackson’s 48 charted dropbacks and played Cover 0 on 17 of them, with his safeties walked up as rushers or man defenders, and Baltimore converted 2 of 14 third downs. The Ravens’ own columnist described an offense “overwhelmed by relentless blitzes.”¹¹

What to notice: before the snap, count the deep safeties. If there are none, and the corners are pressed, it is Cover 0 or a disguise of it, and the ball has to come out in about a second. Flores kept the same idea in Minnesota (he has been the Vikings’ defensive coordinator since 2023, and still is in 2026), where the Cover 0 look is as often a disguise as a call.

Rush three, drop eight

At the other end of the dial is a call that sounds like giving up: **rush three, drop eight**. Three rushers, eight defenders in coverage, usually on third-and-long.

¹⁰Course calculation from nflverse `load_participation()`: Cover 0 as a share of third-down dropbacks with a charted `defense_coverage_type`, by defense, regular seasons. 2020–2022 coverage labels come from NGS and 2023 onward from FTN, so seasons on either side of the break are not directly comparable; within-season ranks are. Miami 2021 rank: 1. Flores’s career (Patriots scouting staff 2004–2007 and coaching staff 2008–2018, Dolphins head coach 2019–2021, Vikings defensive coordinator from 2023): “Brian Flores,” Wikipedia, https://en.wikipedia.org/wiki/Brian_Flores ; his 2026 status, this book’s fact sheet of 2026 staffs.

¹¹John Eisenberg, “The Breakdown: Eisenberg’s Five Thoughts on the Loss to Miami,” BaltimoreRavens.com (Nov. 12, 2021): <https://www.baltimoreravens.com/news/the-breakdown-eisenberg-s-five-thoughts-on-the-loss-to-miami> (“The Dolphins succeeded in pressuring Jackson with a heavy diet of blitzes and a Cover Zero scheme”; “overwhelmed by relentless blitzes”). Score, records and the rush and coverage counts: course calculation from nflverse play-by-play and participation (NGS charting) for game 2021_10_BAL_MIA; other counts circulated after the game (for example “31 of 50 dropbacks”) use different definitions of a dropback and of all-out pressure. Eisenberg also gives Baltimore’s third downs as “two of 14,” as the course count does. Records going in (Ravens 6–2, Dolphins 2–7) and the 22–10 final: Pro Football Reference, <https://www.pro-football-reference.com/boxscores/20211110mia.htm> ; BaltimoreRavens.com game page, <https://www.baltimoreravens.com/game-day/2021/reg-week10/ravens-at-dolphins> .

Figure 7: Rush three, drop eight on third-and-12 (illustrative). Three linemen rush; a stand-up edge player (B) who looked like a fourth rusher drops instead. Behind them, five underneath defenders sink to 11 to 13 yards, right on the line to gain (orange), and three deep defenders sit at 22 to 25 yards. Every curl and dig at the sticks runs into a defender. The offense has five blockers for three rushers, so two linemen are spare and can double-team, and the back’s checkdown is wide open, ten yards short.

The logic is the sticks defense taken to its limit. On third-and-12 the offense needs a completion past 12 yards, and eight defenders can put a body in every window at that depth and still keep three deep. The quarterback is offered the checkdown and little else.

The price is **time**. Three rushers against five blockers will rarely get home quickly: the offense has two spare linemen to double-team the best rusher, and the quarterback can hold the ball for four seconds or more. Given that long, receivers can run a second route, and a quarterback who can move will find the gaps in the rush and scramble through them. That is why rush-three calls often come with the next section’s idea attached, a defender assigned to the quarterback, and why defenses mix them with pressure: a quarterback who sees three rushers on one third-and-long can’t assume he’ll get time on the next.

How rare is it, and does it work? Across 2023–2025 defenses rushed three or fewer on 8% of third-and-11-or-more dropbacks and 4% at 7 to 10. On third-and-7 or longer, offenses converted 21% against three or fewer rushers, 24% against four and 31% against five or more, though the three-man rushes came disproportionately on the very longest downs, which are the hardest to convert anyway.¹² Sack rates run the other way, as you’d expect: 7.7% with three rushers, 12.4% with five or more.

Some defenses lean on it. Brian Flores’s 2023 Vikings, the league’s heaviest blitzers that season, also rushed three or fewer on 30% of their third-and-7-or-longer dropbacks, the most in the NFL: a defense that might send seven or three, from the same look. In 2025 the leaders were Jesse Minter’s Chargers (19%; Minter is the Ravens’ head coach in 2026) and Kelvin Sheppard’s Lions (18%).

¹²Course calculation from nflverse `load_participation()` (FTN charting) and play-by-play, 2023–2025 regular seasons, third-and-7-or-longer dropbacks by `number_of_pass_rushers`; conversion as defined above; sack rate is sacks per dropback. Team rates are shares of each defense’s third-and-7-plus dropbacks with three or fewer rushers. Minter was the Chargers’ defensive coordinator in 2024–2025 and Sheppard the Lions’ in 2025 (and 2026); Minter’s 2026 job and Sheppard’s 2026 status: this book’s fact sheet of 2026 staffs.

! Why it exists: rush three, drop eight

What it solves: on third-and-long the offense needs a completion past the sticks, so the defense puts its numbers where the completion has to happen, and accepts a free short throw. **What it gives up:** the pass rush. With only three rushing, the quarterback gets time, and time eventually beats any coverage. It works best against quarterbacks who don't run and offenses without a receiver who can turn a checkdown into twelve yards, and it works only as one call in a mix.

The spy

The last family answers a problem that third-and-long creates for itself. Drop eight into coverage, or even seven, and the coverage covers everyone *except* the man with the ball. A quarterback who can run looks downfield, sees every receiver covered, sees the rush lanes open, and runs for the first down. On third-and-8, a scrambling quarterback needs only one good cut.

The defense's answer is the **spy** (or **QB spy**): a defender assigned not to a receiver or a rush lane but to the quarterback himself. He stands at linebacker depth, usually 5 to 7 yards off the ball and in front of the quarterback, keeps his eyes on him, and mirrors him. If the quarterback throws, the spy has done nothing, which is the price. If he runs, the spy meets him.

Figure 8: A spy on third-and-6 (illustrative). The defense plays Cover 1, man coverage on the five eligible receivers (dotted lines) with one deep safety, rushes four, and assigns the Mike linebacker (purple ring) to the quarterback. The ends rush wide to keep contain, so the quarterback can't escape outside; when he steps up and escapes through the B gap (between guard and tackle), the spy, who has been mirroring him from 5 to 6 yards, closes on him short of the line to gain. In an ordinary Cover 1 this Mike might have been the robber in the middle of the field; using him as a spy costs the defense that help in coverage.

Who spies? Someone fast enough to match a running quarterback and big enough to tackle him: usually a linebacker, sometimes a safety or nickel back against the fastest quarterbacks, occasionally a defensive lineman who "rushes" by stepping up and sitting in the middle (and a linebacker assigned to the back can be a *green dog*, who rushes only if the back stays in to block; Linebackers and the Second Level). The spy is often paired with the rush lanes from The Pass Rush: the rushers' job against a running quarterback is less to sack him than to keep him in the pocket, and the spy is the last line if he gets out.

The trade is the familiar one: the spy is a defender who isn't covering anyone. In Cover 1 he usually replaces the robber, so the middle of the field loses its best in-cut defender; in zone he is one fewer underneath player. A spy can also be *used*. Offenses run a receiver right at him to make him choose, or send the back on a route he has to respect, and a linebacker spying a quarterback who is faster than he is can be outrun to the sideline. Like every third-down call, it works best as one of several from the same look.

Lamar Jackson, the most dangerous running quarterback of his era, sees spies as often as anyone, and two games a year apart show both sides of the bargain.

Chiefs 2024, opening night (September 5). Kansas City moved linebacker Leo Chenal all over its front (in the box, on the defensive line and over the slot) and used him to spy Jackson in key moments, mirroring him and running him down on scrambles.¹³ It didn't stop the running: Jackson carried 16 times for 122 yards, including 10 scrambles, and on third down he ran 5 times for 39 yards and 3 conversions. The Chiefs won anyway, 27–20, in a game decided on its final snap.

Lions 2025, Week 3 (September 22, *Monday Night Football*). Detroit's coordinator Kelvin Sheppard, who had earlier said publicly that he didn't like using a spy, built a plan around one and made it hard to find. Jackson ran 7 times for 35 yards, was sacked 7 times, and the Lions won in Baltimore, 38–30. Sheppard gave the credit not to the spy but to the disguise around it: "it's because we're making everything look the same," he said, "and when you do that, it's impossible to know who's coming, who's the spy, who's in coverage."¹⁴

What to notice: before a third-and-medium snap against a running quarterback, look for the linebacker who sits straight in front of him at 5 or 6 yards and doesn't move with any receiver. After the snap, watch him: a spy shuffles with the quarterback's shoulders. A green-dog rusher who comes forward late is the same idea, disguised.

Is third down a skill?

Third down feels like the purest test of a team, and it is a big one. But it is also a small sample: a team faces roughly 200 to 230 third downs a season, and every one is a coin weighted by distance. Two consequences are worth knowing.

First, **early downs decide a lot of third down.** A team that is on schedule faces third-and-3, not third-and-9, and converts more often without being any better *at* third down. Across 2016–2025, a team's success rate on first and second down predicted its third-down conversion rate the *next* season (correlation 0.33) nearly as well as its own third-down rate did (0.39).¹⁵

Second, **defensive third-down numbers are noisy.** A defense's third-down conversion rate allowed carried over from one season to the next with a correlation of only 0.20. A defense that "gets off the field" one year often doesn't the next, which is a reason to judge third-down defenses on what they do (pressure, coverage, tackling) more than on the conversion rate alone. Offenses are more stable, but the gap between the best and worst is still modest: in 2025 the best offense converted 51% of its third downs, the worst 32%.

None of that makes third down unimportant; it makes it *consequential and noisy at once*, which is exactly what you'd expect of a single high-stakes snap. Expected Points, EPA, and Success Rate has the tools to measure it.

¹³Charles Goldman, "Chiefs' third-year linebacker sent a message to the rest of the NFL with his dominant Week 1 performance," *A to Z Sports* (Sept. 9, 2024): <https://atozsports.com/nfl/chiefs-leo-chenal-sent-message-rest-of-the-nfl-dominant-week-1-performance/> (Chenal "lined up in five different positions in the box, two different positions on the defensive line, and as an overhang defender in the slot"; he kept Jackson from beating the Chiefs with his legs "in key moments"). Arrowhead Pride's film review of his role is at <https://www.arrowheadpride.com/2024/9/14/24243203/chiefs-roster-leo-chenal-honored-expanding-role-defense>. Jackson's carries, yards and scrambles, the third-down runs and the score: course calculation from nflverse play-by-play, game 2024_01_BAL_KC (designed runs and scrambles; kneel-downs excluded).

¹⁴John Maakaron, "Detroit Lions DC reveals when QB spy folder built," *Sports Illustrated* (All Lions, Sept. 25, 2025): <https://www.si.com/nfl/lions/onsi/news/detroit-lions-dc-reveals-when-qb-spy-folder-built> (reporting Sheppard's earlier public displeasure with spies, and his answer: "I wouldn't believe much that I ever say about schematic things in public"; also "I've had that QB spy folder built for three years"; "It's not because of a spy guys, it's because we're making everything look the same"). Score, sacks and Jackson's rushing: course calculation from nflverse play-by-play, game 2025_03_DET_BAL.

¹⁵Course calculation from nflverse play-by-play, regular seasons 2016–2025: team-season third-down conversion rate (runs and passes) and first- and second-down success rate, correlated with the same team's third-down conversion rate the following season (288 team-season pairs). The defensive correlation uses third-down conversion rate allowed.

Film room: the Patriots' option routes

 Film room: Patriots 2009–2019 — Welker, Edelman and the sticks

The Patriots of the Tom Brady era built much of their third-down offense on slot receivers running option routes set just past the sticks (Passing Game Fundamentals and The Quick Game introduce the route and Wes Welker). The data shows what that meant on third down.

- **Wes Welker, 2009–2012.** Welker was New England's most-targeted receiver on third down in 4 of those 4 seasons and the target on 28% of Brady's third-down throws to a named receiver. Those throws converted 48% of the time, against 39% for third-down targets across the league. And the typical Welker target was thrown **exactly to the line to gain**: the median distance between the throw's depth and the sticks was 0 yards. That is the option route against zone: find the gap at the line to gain, sit down in it facing the quarterback, catch the ball and fall forward. (Air yards are measured where the ball is caught, so a receiver who settles right on the line and turns upfield still converts.)
- **Julian Edelman, 2013, 2016 and 2019** (the three seasons in which he played all 16 games; he missed 2017 injured): 26% of third-down targets, converting 45% against a league 41%.¹⁶

Why did it work? Because the option route attacks the defense's third-down plan at its core. Against man coverage the slot defender has to choose a side, and the receiver breaks the other way; against zone the receiver sits down in the gap at the sticks, facing the quarterback. Brady could throw before the break was finished, because he and his receiver read the same defender. **What to notice** on old Patriots third downs: the slot receiver's first few steps are the same every time; the break comes at the sticks; the ball is in the air before he turns.

Watch for it on Sunday

 Watch for it

Past the sticks? On every third down for one half, make a prediction before the snap and check it after.

- **Say the bucket out loud:** short (1–3), medium (4–6), long (7–10) or very long (11+). Then make the base-rate call: short, run or quick pass; medium, quick man-beater; long, a route past the sticks against pressure; very long, a safe completion or a draw.
- **Read the package.** How many defensive backs came on? Did a big tackle leave for a pass rusher? How many defenders are within five yards of the line, and how many deep? No deep safety means Cover 0; three or four deep with linemen standing up means the defense may drop eight.
- **Find a spy.** Against a running quarterback, look for a linebacker or safety sitting in front of him who isn't lined up on any receiver.
- **Predict the target: past the line, or short of it?** Then, after the play, note where the ball was caught relative to the orange line, and who made the tackle.
- **For your log:** for each third down, write the bucket, your prediction (past or short), what happened, and the number of rushers. Over a game you'll see the defense's third-down personality (pressure, sticks, or both) and whether the offense's targets live past the line or short of it.

¹⁶Course calculation from nflverse play-by-play, regular seasons: New England third-down pass attempts with a named receiver (sacks and scrambles excluded); league rate is all teams' third-down targeted attempts in the same seasons. Receiver names are missing from about four in ten 2007–2008 nflverse pass plays, so Welker's 2007–2008 seasons are left out. Median "throw depth minus yards to go" uses `air_yards`. Edelman's 16-game seasons: Pro Football Reference, <https://www.pro-football-reference.com/players/E/EdelJu00.htm>. He missed the 2017 season with a torn ACL: "Julian Edelman," Wikipedia, https://en.wikipedia.org/wiki/Julian_Edelman. The comparison is not adjusted for distance; Welker's and Edelman's targets came at slightly shorter average distances than the league's.

Predict the play

💡 Predict the play 1: third-and-2, nobody deep

Figure 9: Third-and-2 near midfield. The offense is in 11 personnel, 2x2, with the back beside the quarterback. The defense has the Mike (M) and Will (W) standing in the A gaps, the nickel (\$) pressed on H, both corners pressed, and both safeties (green rings) walked down to 6 or 7 yards. Nobody is deeper than that.

What is the defense likely to do, and what should the offense want to have called?

Answer 1 is at the end of the chapter. Try it first.

💡 Predict the play 2: third-and-13, everybody back

Figure 10: Third-and-13 from the offense's own 20. The defense has three linemen with their hands down (E, N, E) and a stand-up edge player (B), one linebacker (M) at 7.5 yards, six defensive backs: the nickel (\$) and the dime back (D) 7 yards off the slots, the corners 10 off, and two safeties 15 deep.

How many will rush, where will the coverage sit, and what would you call if you were the offense?

Answer 2 is at the end of the chapter. Try it first.

💡 Predict the play 3: third-and-5 against a quarterback who runs

Figure 11: Third-and-5 at midfield; the quarterback is one of the league's best runners. The defense presses the corners and walks the nickel (\$) and the strong safety (SS) up on the slots, with one deep safety (FS). Four linemen are down, the Will (W) is at 4.5 yards over the back, and the Mike (M, green ring) stands 5.5 yards deep, directly in front of the quarterback, lined up on no one.

What is the Mike's job, what coverage is behind him, and where is the offense's best throw?

Answer 3 is at the end of the chapter. Try it first.

Takeaways

- **Third down decides drives**, about three points of expected value on one snap, and the league converts about two in five, every year. The distance is the whole story: short third downs are converted most of the time, very long ones rarely.
- **The distance is information, so both sides specialise.** Defenses add defensive backs and pass rushers as the distance grows; offenses set their routes by the line to gain, put their best receiver where he can win, and keep a third-down back.
- **Aim a yard or two past the sticks.** Third-down throws aimed there convert most often; throws short of the line rarely do, except on third-and-short, in four-down territory, or when the yards after the catch are the plan. Option routes, rubs and mesh exist to win that yard against man coverage.
- **The defense picks a point on a dial:** Cover 0 on short yardage, pressure (real and simulated) on third-and-7 to 10, sticks defense and rush three/drop eight on very long, and a spy when the quarterback can run. Each call gives something up, and the best defenses show the same look for all of them.
- **Third-and-long is often about the possession, not the down.** Screens and draws rarely convert, but they avoid disasters, shorten punts, and keep the rush honest for the next one.
- **Third down is consequential and noisy.** Early-down success predicts it nearly as well as past third-down success does, and defensive third-down rates barely carry over year to year.

Connections

Builds on: Downs, Distance, and Field Position (the line to gain, the buckets, EPA and success rate), Early Downs and Field Zones (staying on schedule, and four-down territory), Zone Blitzes, Fire Zones, and Simulated Pressure and Blitzing (the pressures third down uses most), Man Coverage (Cover 1 and Cover 0), Passing Game Fundamentals and Dropback Concepts (option routes and man-beaters), and Gap Schemes (the draw).

Sets up: Red Zone, Goal Line, Two-Point Plays, and Short Yardage, where third-and-1 becomes the sneak and the field shrinks; The Clock, the Two-Minute Drill, and Fourth Down, where a failed third down becomes a fourth-down decision; and Win Probability and Decision Analysis, which models it. The Game Plan shows where the third-down plan is built.

Case studies: Case Study: Belichick and Game-Plan Football (the option-route offense and the man-pressure defense that both lived on third down) and Case Study: Fangio’s Two-High Revolution and Macdonald’s Answer (simulated pressure from a two-high shell, the modern third-down defense).

Answers to Predict the play

Answer 1.

A Cover 0 blitz is the likeliest reading: man on every receiver, nobody deep, six or more rushing. Count the deep players: none. Both corners and the nickel are pressed, the man technique. With the two linebackers mugged in the A gaps and both safeties walked down, the defense has up to eight possible rushers and no one to protect against a long completion, which only makes sense on a short-yardage down, where Cover 0 is most common (9% of charted third-and-1-to-3 dropbacks in 2023–2025). It could still be a disguise: one safety may bail at the snap into a Cover 1, and one of the mugged linebackers may drop.

What the offense wants is a quick throw that beats tight man coverage before the rush arrives: a slant from X or Z against an outside-leverage corner, a rub between H and the back, or a quick out. A run is also live, but with eight defenders near the line it needs a hat on every one of them, and the sneak (Red Zone, Goal Line, Two-Point Plays, and Short Yardage) is the one run that doesn’t. What the offense should *not* have called is a slow-developing route past the sticks: on third-and-2 it doesn’t need one, and against six rushers it won’t get time.

Answer 2.

Three or four rushers, with the coverage sitting at the sticks. This is the third-and-very-long package: dime personnel, only three hands in the dirt, and everybody else deep. The stand-up edge player is the swing man: he may rush (four) or drop (three rush, eight drop). Either way, expect the underneath defenders to sink to 12 or 13 yards and the safeties to stay deep, so that every route that converts runs into a defender and every route that’s open is short.

The offense’s options are the third-and-long menu. If it wants the first down, it needs time and a route that finds a seam *between* the sticks-sitting defenders, with the quarterback ready to scramble if only three rush. If it wants the possession, the draw and the screen are built for this exact picture: a light box, linebackers dropping, rushers chasing upfield. From its own 20, a 9-yard draw that sets up a punt from the 29 is a reasonable outcome, and an interception at the 35 is the disaster to avoid.

Answer 3.

The Mike is probably a spy, in Cover 1. Every receiver has a defender pressed or tight on him (the corners on X and Z, the nickel on H, the safety on Y, the Will on the back), one safety is deep, and the Mike is lined up on nobody, square to the quarterback at spy depth. Against a quarterback who runs on third-and-5, the defense has given up its robber to keep him in the pocket.

Where to throw: the middle of the field at 6 to 8 yards, where the robber would have been. A crossing route or an option route from a slot receiver breaking inside, a yard or two past the sticks, has only its man defender to beat, with the spy watching the quarterback instead of the throwing lane. Another answer is to make the spy choose: send the back on a route right at him, or run a slot receiver across his face. And if the defense guessed wrong about the rush, the quarterback still has his legs: a spy who is slower than the quarterback has to be right about the angle.
