

The Clock, the Two-Minute Drill, and Fourth Down

How teams buy and sell seconds, why the last two minutes of a half look like a different sport, and how fourth down went from a punting down to a decision

Super Bowl LVIII, fourth quarter. San Francisco has just kicked a field goal to lead 19–16, and Kansas City takes over at its own 25 with 1:53 on the clock and two timeouts. It sounds like plenty of time. Is it? Seventy-five yards from a touchdown and about 40 from a long field goal, 113 seconds is less than it looks: a completion over the middle costs about 20 of them, a sack more, an incompletion only five. Over the next 107 seconds Kansas City will run eleven snaps, call one timeout, get two plays out of bounds and kick a field goal with three seconds left. Then the game goes to an overtime whose rules were rewritten after a Chiefs game two years earlier. This chapter explains every one of those choices, and the fourth-down revolution that changed how coaches spend the other 58 minutes.

You'll be able to:

- Price any play in game-clock seconds, and say whether the clock will run after it, using the out-of-bounds clock rule and the late-game exceptions.
- Run a two-minute drill in your head: which throws save time, when to spike and when to use a timeout, and why a 10-second runoff can end a half.
- Do the kneel-down arithmetic for a team protecting a lead, and recognise the four-minute offense and the victory formation.
- Make end-of-half calls: take the points or take a shot, Hail Mary or field goal, and spot the rare plays that decide close games, the intentional safety and the fair-catch kick.
- Use simple fourth-down and two-point heuristics, and explain how and why the league's go-for-it rate rose after 2017.
- Apply the current overtime rules (playoffs since 2022, regular season since 2025) and predict how each team will play them.

You'll need

- **Red Zone, Goal Line, Two-Point Plays, and Short Yardage:** the plays teams run on fourth-and-short and from the 2-yard line. This chapter decides *whether* to run them; that one designs them.
- **Field Goals, Extra Points, and the Punting Game:** **field goal range** (line of scrimmage plus 18 is the kick's length), the **fair catch** and the **touchback**.
- **In-Game Adjustments and Tempo:** **tempo** and the **hurry-up offense**, and the substitution rule that lets an offense that keeps the same players snap the ball quickly.
- **Officiating, Replay, and the Rules of the Ball:** **intentional grounding**, forward progress and **booth review**, which takes over from coaches' challenges after the two-minute warning.
- From the very first chapter, *The Game in Fifteen Minutes*: when the **game clock** runs and stops, the 40-second **play clock**, three **timeouts** per half and the **two-minute warning**.

The clock is a currency, and the two teams want opposite things

For 56 minutes of a typical game the clock is background noise. Then, at some point in the fourth quarter (and again at the end of the first half), it becomes the most important player on the field. The reason is simple: possessions are scarce, and time is what possessions are made of. A team that is behind needs **plays per second**: as many snaps as it can squeeze into the time left. A team that is ahead wants **seconds per play**: the fewest snaps, each taking as long as possible, so the opponent gets the ball back late or never.

Everything in this chapter follows from those two goals, and from one fact you met in the first chapter: the clock keeps running after a ball carrier is tackled in bounds and stops after almost everything else. So the first skill is pricing. How many seconds does each kind of play cost a team in a hurry? You can measure it. The play-by-play data records the game clock at every snap, so the gap between two snaps is what the first play, and whatever happened after it, cost.

Figure 1: What a play costs a hurrying offense. Median game-clock seconds from one snap to the next, for offenses trailing or tied in the last two minutes of the first half and the last two minutes of the game (2016-2025 regular seasons, no penalties; numbers in brackets are plays). An incompletion or a catch that goes out of bounds costs only the five or six seconds the play itself takes. A catch in bounds keeps the clock running while everyone sprints back to the line: about 16 seconds if the offense then spikes the ball (which also uses up a down), about 21 if it lines up and runs a real play. A timeout stops the bleeding for the price of the timeout. Source: nflverse play-by-play.

Read it as a price list. The cheapest plays are the ones that stop the clock by themselves: an incomplete pass, or a completion where the receiver gets out of bounds. Each costs only the five or six seconds the play takes. The expensive one is the catch in bounds, because the clock keeps running while eleven players run back to the line, the officials spot the ball and the quarterback relays the next call. That costs about 21 seconds if the offense simply runs its next play. Offenses have two ways to cut the bill. A **timeout** brings the cost back down to the play itself (6 seconds) but spends one of only three. A spike, which you'll meet properly below, stops the clock about 16 seconds after the previous snap, and spends a down instead.

That is why two-minute offenses throw toward the sideline, why defenses protecting a lead try to tackle receivers *inside* the field, and why coaches hoard timeouts like cash. A team with 1:53 and two timeouts can afford roughly five or six in-bounds completions and a few incompletions. That is enough for 50 or 60 yards. It is not as much as it sounds.

The out-of-bounds clock rule

One line in the price list has a condition attached. "Out of bounds stops the clock" is true only late in a half. The full rule, which this course calls the **out-of-bounds clock rule**, is this: when a runner goes out of bounds, the officials stop the clock, put the ball back on the hash, and **restart the clock when the referee signals the ball ready for play**, well before the next snap. The exceptions are the moments when time matters most. After the **two-minute warning of the first half**, and inside the **last five minutes of the game**, the clock stays stopped **until the snap**. (So does the first snap after a change of possession, at any time.)¹

¹NFL Rulebook (2026), Rule 4, Section 3, Article 2(a): "Whenever a runner goes out of bounds on a play from scrimmage, the game clock starts on the Referee's signal that a ball has been returned to play, except that the clock will start on the snap: (1) after a change of possession; (2) after the two-minute warning of the first half; or (3) inside the last five minutes of the second half"; Article 2(f): a fumble or backward pass out of bounds restarts on the ready signal. <https://operations.nfl.com/the-rules/nfl-rulebook/>

Figure 2: When does getting out of bounds actually save time? The game's 60 minutes, quarter by quarter. In the white stretches (most of the game), a runner who goes out of bounds stops the clock only for the few seconds it takes to re-spot the ball; it restarts on the referee's ready signal. In the shaded windows (after the two-minute warning of the first half, and the last five minutes of the fourth quarter) it stays stopped until the next snap. The rule's asymmetry is deliberate: the fourth-quarter window is wider because the end of a game decides the result.

Why the exception? Because without it the end of every close game would be a parade of five-yard sideline throws, each stopping the clock for free. Early in the game the league *wants* the clock to keep moving (television windows are three hours), so out of bounds costs the offense only a few seconds of saving. Late in a half the rule hands the trailing team a lifeline: it can save time without spending timeouts, as long as it can get the ball to the sideline. One detail closes a loophole: a **fumble** that goes out of bounds restarts the clock on the ready signal at any time of the game, so nobody can fumble out of bounds on purpose to stop it.

🔥 Common misconception

"He stepped out of bounds, smart: that stopped the clock." In the third quarter, or with 7:00 left in the fourth, it barely did: the clock started again as soon as the ball was spotted, usually 25 or more seconds before the next snap. A runner who fights for two extra yards in bounds early in the fourth quarter is not costing his team time. The same play at 4:30 is a different story.

The two-minute drill

The **two-minute drill** is the hurry-up offense with a deadline: a team that needs points before a half ends, usually with the clock already inside the two-minute warning. Teams practise it every week as its own script, because almost every rule of normal play-calling changes:

- **No huddle, two plays at a time.** The quarterback gets two calls through his helmet radio (or carries them on his wristband), so after the first one the offense can line up and snap the second without waiting for a signal. Many teams use one-word "clock" calls for plays the whole offense knows.
- **Throw outside.** Routes break toward the sideline (outs, comebacks, corner routes) so that the catch ends out of bounds. Receivers are coached to secure the ball, take one more step, and get out: never turn upfield for two extra yards and get tackled in bounds.
- **Middle of the field only with a plan.** A catch over the middle is worth taking if it gains a lot or if the offense has a timeout to spend. Otherwise it costs about 20 seconds.
- **No sacks.** A sack loses yards *and* keeps the clock running. Quarterbacks throw the ball away instead (out of bounds, past the line of scrimmage, or near a receiver) and accept the lost down.
- **Know the finish line.** The real target is usually not the end zone but **field-goal range**: the yard line from which the kicker has a good chance, with enough time left to get the field-goal unit on.

Figure 3: The two-minute menu. The offense (blue) has the ball near midfield and needs about 25 yards to reach field-goal range; the defense (orange) sits back in a soft two-deep zone and invites throws underneath. The outside receivers run sideline routes: X an out at 12 yards, Z a comeback at 15 (straight up the field, then back toward the sideline). Inside, H runs a corner route toward the sideline as well and Y a seam up the middle; the back (R) checks into the flat. The shaded lanes between the numbers and the sideline are where a catch can end out of bounds and stop the clock. A completion in the middle costs about 20 seconds unless the offense calls a timeout.

What does the defense do about it? It plays the same game backwards: it sits deep enough that nothing gets behind it, keeps its cornerbacks outside the receivers so the sideline routes are contested, and tackles in bounds. That tug-of-war, offense pulling the ball outside and defense pushing it inside, is the whole two-minute drill in one sentence.

! Why it exists

The two-minute drill exists because the clock rules are asymmetric. The offense can stop the clock (incompletions, out of bounds, timeouts, spikes); the defense can only stop it with timeouts and by forcing incompletions. So the trailing offense, uniquely, gets to *control the pace* of the end of a half. The drill is the set of habits that turns that control into points, and it has to be rehearsed because the habits contradict normal football: throw away from the open middle, give up yards for seconds, and never take a sack.

The drill has a long history in big games. In the 1958 NFL Championship Game, Johnny Unitas drove the Baltimore Colts into position for Steve Myhra's tying field goal with seven seconds left, and the Colts won in the first sudden-death overtime in NFL history.² In January 1987 John Elway's Broncos went 98 yards in Cleveland, starting with 5:32 left ("The Drive"), to force overtime in the AFC Championship Game. And in Super Bowl XXXVI, with the score tied, 1:21 left and no timeouts, Tom Brady took the Patriots from their own 17 to the Rams' 30 with two spikes along the way, and Adam Vinatieri kicked the 48-yard winner as time ran out.³

The spike

A **spike** is the quarterback taking the snap and immediately throwing the ball into the ground. It is an incomplete pass, so the clock stops. Why isn't it intentional grounding, which is exactly "throwing the ball away to avoid a loss with no receiver nearby"? Because the rulebook carves out an exception for it: a quarterback under center may stop the clock legally if, *immediately* upon

²Pro Football Hall of Fame, "The Greatest Game Ever Played" (1958 NFL Championship, Colts 23, Giants 17 in overtime, December 28, 1958; Myhra's tying 20-yard field goal with seven seconds left): <https://profootballhof.com/news/greatest-game-ever-played>; on The Drive (AFC Championship, January 11, 1987; 98 yards in 15 plays from the Denver 2, starting with 5:32 left, the tying touchdown with 39 seconds left): "The Drive (American football)," Wikipedia: [https://en.wikipedia.org/wiki/The_Drive_\(American_football\)](https://en.wikipedia.org/wiki/The_Drive_(American_football))

³nflverse play-by-play, game 2001_21_STL_NE (Super Bowl XXXVI, February 3, 2002): New England's drive began at its own 17 with 1:21 left, with spikes logged as incompletions at 0:41 and 0:07, and Adam Vinatieri's 48-yard field goal as time expired. The Patriots had no timeouts: "Super Bowl XXXVI," https://en.wikipedia.org/wiki/Super_Bowl_XXXVI

receiving the snap, he begins a continuous throwing motion and throws the ball directly into the ground. If he waits, he may not: a delayed spike is grounding.⁴

The spike costs about 1 second of clock and **a down**. That second cost is the real one. Spiking on first down is cheap (second-and-10 is fine in a two-minute drill); spiking on second down leaves only one real play before fourth down; spiking on third down is almost always a mistake. Teams spike about 72 times a season in all. You will see it most often in the sequence the price list describes: an in-bounds completion, a frantic sprint to the line, the line set, and the ball slammed into the turf with 15 to 20 seconds gone.

When should a team with a timeout spike instead of using the timeout? When there is time for more plays after it. A timeout is the more valuable token, because it keeps the down. Coaches spend timeouts late, for the field goal (the kicking unit needs a stopped clock to run onto the field) or for a catch in the middle near the end, and use the spike to keep them.

i Go deeper: the fake spike

Once everyone expects a spike, the threat of one is a weapon. On November 27, 1994, against the Jets, Dan Marino ran to the line at the Jets' 8 with under 40 seconds left, shouted "Clock! Clock!", made the spike motion, and instead threw a touchdown to Mark Ingram while the defense straightened up; the Dolphins won 28–24.⁵ The fake spike still shows up occasionally, and it is why a defense facing a hurried line-up can never completely relax. It works only because the real spike is so common.

Timeouts and the 10-second runoff

Timeouts are the scarcest resource in the two minutes: three per half, and none carry over. Their value depends on when they are used. A timeout early in a half saves the 20-odd seconds between plays, but those seconds rarely matter. The same timeout in the last minute can be the difference between a field goal and no field goal. That's why you'll hear announcers criticise a coach for "wasting" a timeout on a substitution mix-up in the third quarter: it is the end-of-half timeout he's spending.

The rules guard the clock against cheap tricks. After the two-minute warning of either half, if the offense stops the clock by breaking a rule (a false start or other foul while the clock is running, intentional grounding, an illegal forward pass, a backward pass thrown out of bounds, spiking the ball *after* a play has ended), the officials take **ten seconds off the game clock**, the **10-second runoff**, and restart it on the ready signal. The offense may spend a timeout instead, if it has one, and the defense may decline the runoff along with the yardage penalty. A defense is never charged a runoff: if it fouls to stop the clock, the clock simply starts on the ready signal, and in the last 40 seconds a defensive time-saving foul can end the half if the defense has no timeouts left.⁶

The runoff also applies when a **replay** changes a stopped clock into a running one after the two-minute warning. If a receiver ruled out of bounds is shown to have been tackled in bounds, the clock should never have stopped, so ten seconds come off, and neither team can decline them (either can use a timeout to prevent them). **Either half can end on a runoff**, and one famous game did.

⁴NFL Rulebook (2026), Rule 8, Section 2, Article 1, Item 3 ("Stopping Clock. A T-Formation Quarterback is permitted to stop the game clock legally to conserve time if, immediately upon receiving the snap, he begins a continuous throwing motion and throws the ball directly into the ground") and Item 4 ("Delayed Spike. A passer, after delaying his passing action for strategic purposes, is prohibited from throwing the ball to the ground in front of him"). The spike counts and timing are a course calculation from nflverse play-by-play, 2016–2025 regular seasons ([qb_spike](#)).

⁵Miami Dolphins, "Fake Spike 25th anniversary flashback" (Dolphins 28, Jets 24, November 27, 1994, at Giants Stadium; the touchdown to Mark Ingram came with 22 seconds left): <https://miamidolphins.com/news/fake-spike-25th-anniversary-flashback-dan-marino-new-york-jets> ; accounts of the play (ball at the Jets' 8 with 38 seconds left, Marino yelling "Clock! Clock! Clock!") collected at https://barrypopik.com/blog/fake_spike

⁶NFL Rulebook (2026), Rule 4, Section 7: Article 1 (acts that may not be used to conserve time after the two-minute warning; Item 1, a 10-second runoff for the offense, avoidable with a timeout; the defense may decline it along with the yardage), Article 3 (defensive time-saving fouls in the last 40 seconds), Article 4 (runoff after a replay reversal or a nullified foul: "Neither team can decline the runoff, but either team can use a remaining timeout to prevent it"); Rule 4, Section 5, Article 4, Note 4 ("Either half can end as the result of the 10-second runoff") and Note 9 ("There can never be a 10-second runoff against the defensive team").

Week 3 of the 2017 season, Atlanta led Detroit 30–26 in the last seconds. Detroit had no timeouts. On third-and-goal from the 1 with 12 seconds left, Matthew Stafford hit Golden Tate on a short pass, and the officials signalled touchdown. The booth reviewed it (all scoring plays are reviewed), and the replay showed Tate down short of the goal line, at the 1. A touchdown stops the clock; a runner tackled in bounds does not. The clock had stopped with eight seconds left; under the replay rule it goes back to the moment the play should have ended and then runs ten seconds, and with fewer than ten seconds left the game is simply over.⁷ What to notice: the Lions lost not because the play failed by a foot, but because they had no timeout to absorb the runoff. A single timeout saved for the end would have bought one more snap from the 1.

An annotated two-minute drive

Back to the opening scene. Here is every snap of Kansas City’s drive at the end of regulation in Super Bowl LVIII, plotted the way a clock manager thinks about it: time on one axis, field position on the other.

Figure 4: Super Bowl LVIII (February 11, 2024), Kansas City’s drive at the end of regulation, trailing 19-16. Each dot is a snap, placed at its game clock and the ball’s spot; the line to the next dot is green when the clock kept running between the snaps and orange when it was stopped. Kansas City used the cheap stoppages (three incompletions, a scramble and a catch that went out of bounds), spent only one of its two timeouts, after a first down near midfield, and kicked the tying field goal with three seconds left, still holding a timeout in case it needed one for the kick. Source: nflverse play-by-play, game 2023_22_SF_KC.

Four things are worth noticing, because they are what good clock management looks like.

1. **The cheap plays came early.** The first snap was a 9-yard catch in bounds, and then Mahomes, facing second-and-1, scrambled and **got out of bounds**. Inside the last five minutes, that stopped the clock until the next snap. The drive used about 40 seconds to reach midfield, and Kansas City still had both timeouts.
2. **One timeout, when the price was high.** After a third-down conversion at the 49ers’ 36 with the clock running, the Chiefs called their timeout at 0:40, saving about 20 seconds at the moment the seconds started to matter.

⁷nflverse play-by-play, game 2017_03_ATL_DET (September 24, 2017): third-and-goal at the Atlanta 1 at 0:12, Stafford to Tate ruled a touchdown, reversed on review to “ATL 1 for no gain”, followed by END GAME; Detroit had no timeouts. Atlanta Falcons, “Here’s why the Lions score was overruled and the Falcons won on a 10-second runoff” (the clock had stopped with eight seconds left): <https://atlantafalcons.com/news/here-s-why-the-lions-score-was-overruled-and-the-falcons-won-on-a-10-se-19441280> ; ProFootballTalk, “Lions lose on overturned touchdown, 10-second runoff” (Sept. 24, 2017): <https://www.nbcsports.com/nfl/profootballtalk/rumor-mill/news/lions-lose-on-overturned-touchdown-10-second-runoff> . The replay clock rule is NFL Rulebook (2026), Rule 15, Section 5, Article 2 (the clock is reset to when the play should have ended and runs 10 seconds; “If less than 10 seconds remain in the half or the game, the half or the game is over”).

3. **A timeout in the pocket.** After Mahomes's scramble to the 33 stayed in bounds, Kansas City *didn't* use its last timeout; it hurried to the line and threw incomplete at 0:21. The timeout was insurance: as long as the Chiefs held it, any catch, anywhere, could be followed by a field goal.
4. **The decisive catch went out of bounds.** On third-and-7 with 16 seconds left, Travis Kelce caught a pass and was pushed out at the 11, stopping the clock at 0:10. One more shot at the end zone, an incompleteness, and Harrison Butker tied the game with three seconds left.⁸

Notice also what San Francisco did *before* the drive. On fourth-and-5 at the Chiefs' 35, with 1:57 left and the score tied, the 49ers kicked a 53-yard field goal to lead by three. A touchdown there would have forced Kansas City to score a touchdown; the field goal let it tie with a field goal. That is the end-of-half trade-off this chapter returns to later.

The four-minute offense: when the clock is on your side

Flip the situation. You lead by six with four minutes left and you have the ball. Now every second the clock runs is a second the other team can't use. The **four-minute offense** is the two-minute drill in reverse:

- **Run the ball, and run it inside,** where the ball carrier will be tackled in bounds. A 3-yard run that keeps the clock moving beats a 12-yard pass that might fall incomplete.
- **Use the whole play clock.** Snap with one or two seconds left on the 40-second clock. A first down then costs the opponent about 40 seconds per play, or about two minutes per set of downs, if it has no timeouts.
- **Ball security over yards.** A fumble or an interception hands the opponent both the ball and the clock.
- **First downs end games.** The point of the drive is not points; it is a fresh set of downs, each worth roughly two more minutes. Teams sometimes stay in bounds or even go down short of the goal line, rather than score and give the ball back.

The defense's counter is timeouts, used immediately after each running play stays in bounds, and everything it can do to force an incompleteness or a punt. A defense with three timeouts and the two-minute warning to come can stop the clock four times; with none, it can only hope for a stop.

The kneel-down arithmetic

At some point the leading team doesn't need any more yards. It only needs the clock to run out, and the safest play in football is the quarterback kneeling down. Each kneel uses a down and takes about two seconds, and the clock keeps running afterwards, because the quarterback is "tackled" in bounds. Between kneels the offense lets the 40-second play clock run almost to zero. In the play-by-play, consecutive kneels with no timeout between them come about 39 seconds apart.

So the question every leading team asks when it gets a first down late in the game is: **can we kneel it out from here?** With three downs to use (a fourth-down kneel would hand the ball over if time remained), it's arithmetic.

⁸nflverse play-by-play, game 2023_22_SF_KC (Super Bowl LVIII, February 11, 2024): every snap, clock, timeout and score in this chapter's figure and both film rooms, including San Francisco's 53-yard field goal at 1:57, Kansas City's timeout at 0:40 and San Francisco's at 0:10, Butker's 29-yard field goal at 0:06 (19–19 with 0:03 left), the 49ers' overtime field goal (27 yards, 22–19), Mahomes's fourth-and-1 run for 8 yards at his own 34, and the 3-yard touchdown pass to Mecole Hardman. Overtime context from this course's fact sheet (FACTS-current §1 and §4).

Figure 5: The kneel-down arithmetic. The leading team has first-and-10 and the clock is running, with a fresh 40-second play clock. Each kneel lets the play clock run down (green, about 39 seconds) and then takes about two seconds (dark blue). Every timeout the defense has left stops the clock after a kneel, and the next snap then starts the clock again at once (orange tick), so that play clock costs nothing. With no timeouts, three kneels drain about 2:03; each timeout takes about 40 seconds off that. The two-minute warning works exactly like one more defensive timeout if the kneels cross it. With three timeouts, the third one leaves the offense facing fourth down with time still on the clock.

The rule of thumb that falls out: **with no defensive timeouts, a first down with about two minutes or less on a running clock ends the game.** Each timeout the defense holds is worth about 40 seconds, which is why a defense down by four with 2:30 left will start calling timeouts after the *first* running play, not wait. And it is why a timeout is worth more to the team *without* the ball late in the game: it is the only thing that converts the offense's play clock back into usable time.

Two famous games show the leading team taking this arithmetic to its logical end. In December 2007, the Eagles led Dallas 10–6 when Brian Westbrook broke a run into the clear with Dallas out of timeouts; he deliberately went down at the 1 instead of scoring, and Donovan McNabb knelt three times to end the game.⁹ A touchdown would have given Dallas the ball back with about two minutes left; the kneels gave it nothing. And in Super Bowl XLVI, the Patriots, leading by two, *let* Ahmad Bradshaw score with 57 seconds left (he tried to stop at the 1 and fell into the end zone), so that Tom Brady would get the ball back with time on the clock rather than watch the Giants run it down for a chip-shot field goal.¹⁰ Both are the four-minute offense seen from either side: the team with the ball values the clock more than six points, and the defense will pay six points for the clock.

The victory formation

The kneel is so routine that it has its own formation, the **victory formation**, and announcers call the play a **kneel-down**.

⁹nflverse play-by-play, game 2007_15_PHI_DAL (December 16, 2007): Westbrook's 24-yard run to the Dallas 1 at 2:19 with Dallas out of timeouts, followed by three McNabb kneels at 2:00, 1:15 and 0:30; Eagles 10, Cowboys 6. Associated Press, "Westbrook heeded Runyan's advice on stopping at 1" (Dec. 2007), NFL.com: <https://www.nfl.com/news/westbrook-heeded-runyan-s-advice-on-stopping-at-1-09000d5d805331ad>

¹⁰nflverse play-by-play, game 2011_21_NYG_NE (Super Bowl XLVI, February 5, 2012): Bradshaw's 6-yard touchdown run on second-and-goal at 1:04 (the try followed at 0:57), with New England holding one timeout; "Super Bowl XLVI," https://en.wikipedia.org/wiki/Super_Bowl_XLVI (Belichick told his defense to let Bradshaw score; Bradshaw tried to stop short and fell into the end zone).

Figure 6: The victory formation. Seven blockers on the line in tight splits (no gaps for a defender to shoot), both tight ends attached. The quarterback (Q) is under center; two backs stand just behind him on either side, close enough to block a defender who slips through and to fall on the ball if the snap is fumbled. One deep player (S, often a safety or a receiver) stands 12 or more yards back as a last line of defense: if the ball somehow comes loose and a defender scoops it up, he is the only one who can stop a touchdown return. The quarterback takes the snap and kneels; the defense usually doesn't rush hard, by an unwritten rule.

The formation's history is a cautionary tale. On November 19, 1978, the Giants led the Eagles 17–12 with about 30 seconds left and the ball. Instead of kneeling, they handed off; quarterback Joe Pisarcik and fullback Larry Csonka botched the exchange, Eagles cornerback Herman Edwards picked up the loose ball and ran it in, and Philadelphia won 19–17. The “Miracle at the Meadowlands” cost the Giants’ offensive coordinator his job the next day, and teams across the league began kneeling, in a formation built to make that fumble impossible.¹¹

By convention the defense doesn't fight a kneel-down. When the Buccaneers’ Greg Schiano had his defense charge into the Giants’ victory formation in September 2012, knocking Eli Manning to the ground, Tom Coughlin confronted him at midfield and the incident became a league-wide argument about sportsmanship. Schiano’s defence was that the game wasn’t over until the clock hit zero, which is true; the convention survives because a fumble on a kneel is so unlikely that rushing it mostly risks injuries.¹²

¹¹“The Miracle at the Meadowlands,” Wikipedia (November 19, 1978; Eagles 19, Giants 17; Pisarcik, Csonka and Edwards; offensive coordinator Bob Gibson fired the next day): https://en.wikipedia.org/wiki/Miracle_at_the_Meadowlands

¹²Giants 41, Buccaneers 34, September 16, 2012. ProFootballTalk, “Greg Schiano stands by his approach to kneel-downs” (September 17, 2012): <https://www.nbcsports.com/nfl/profootballtalk/rumor-mill/news/greg-schiano-stands-by-his-approach-to-kneel-downs> ; ProFootballTalk, “NFL sides with Buccaneers on kneel-down controversy”: <https://nbcsports.com/nfl/profootballtalk/rumor-mill/news/nfl-sides-with-buccaneers-on-kneel-down-controversy>

In Madden, “kneel” is a button you press once the clock math works. In a real game somebody has to *do* the math, under noise, with the play clock running; down, distance, the opponent’s timeouts, whether the two-minute warning is still to come. NFL staffs keep a clock-management card for exactly this (often a dedicated assistant or the “game management” coach in the booth), and head coaches have been fired over getting it wrong. When a broadcast shows a coach on the headset at 2:15 with the offense jogging to the line, he is usually being read that card.

End of the half: points versus risk

The last minute of the first half has its own logic. There is no next possession to protect against (the second half starts with a kickoff and fresh timeouts), so a team with the ball and time faces a narrower question: **is a shot at points worth the risk of giving the opponent the ball with time to use it?**

Three questions settle most of these calls:

1. **How far to field-goal range, and how many plays do I have?** From the price list: with one timeout, 45 seconds is about four or five plays if half of them go out of bounds or fall incomplete. If those plays can plausibly gain 30 yards, go.
2. **What happens if it goes wrong?** An interception or a three-and-out deep in your own territory gives the opponent a short field. Backed up at your own 10 with 40 seconds, most coaches kneel.
3. **Who gets the ball to start the second half?** If you will receive the second-half kickoff, scoring at the end of the half is a *double score* opportunity: points just before the break, then the ball again immediately. That’s a big reason most coaches defer when they win the coin toss.

The most famous end-of-half argument came at the end of a *game*. In Super Bowl XXXVI, with the score tied and the Patriots starting at their own 17 with 1:21 and no timeouts, the broadcast’s John Madden said they should run out the clock: “You have to play for overtime now.” Bill Belichick and Tom Brady went for it anyway, and New England won on the final play.¹³ Madden was not wrong about the risk; he was underrating the price list. Two short throws to the running back, a spike, a third throw to the back that was pushed out of bounds, an incompleteness and Troy Brown’s 23-yard catch that went out of bounds had the ball at the Rams’ 36 with 21 seconds still left.

The Hail Mary

When there is time for only one snap and the end zone is out of field-goal range, there is one play left: the **Hail Mary**. Four or five receivers sprint to one spot in or near the end zone, the quarterback buys time and throws as high and as far as he can, and everyone converges on the ball. The name comes from the Cowboys’ 1975 playoff game at Minnesota, when Roger Staubach threw a 50-yard winner to Drew Pearson and told reporters afterward that he had closed his eyes and said a Hail Mary.¹⁴

¹³Madden on the Fox broadcast: “With no timeouts, I think that the Patriots, with this field position, you have to just run the clock out. You have to play for overtime now.” Nick Goss, “Madden’s call of Super Bowl XXXVI between Patriots, Rams was legendary,” NBC Sports Boston (December 29, 2021): <https://www.nbcsportsboston.com/nfl/new-england-patriots/maddens-call-of-super-bowl-xxxvi-between-patriots-rams-was-legendary/198445/>. Drive details from nflverse play-by-play, game 2001_21_STL_NE: Redmond for 5 and 8, an incompleteness (the spike) at 0:41, Redmond for 11 pushed out of bounds, an incompleteness at 0:33, Troy Brown for 23 out of bounds at the Rams’ 36 (snapped at 0:29; the next snap came at 0:21).

¹⁴NFC Divisional playoff, Dallas 17, Minnesota 14, December 28, 1975 (50-yard touchdown to Drew Pearson; Staubach, later: “I just closed my eyes and said, ‘Hail Mary’”); HISTORY.com, “This Day in History: December 28”: <https://www.history.com/this-day-in-history/december-28/hail-mary-dallas-cowboys-roger-staubach>; “Hail Mary pass,” Wikipedia: https://en.wikipedia.org/wiki/Hail_Mary_pass

The plan, at the snap

+5.3 s: the crowd gathers, ball on its way

+6.3 s: the ball arrives

Figure 7: A Hail Mary from the opponent's 48 with four seconds left (simulated tracking, BDB format). The five receivers (blue) race to one spot about two yards deep in the end zone; the defense (orange) rushes three and drops eight, with its deep players already near the goal line before the snap. The quarterback buys time with a deep drop and throws at about three seconds; the ball is in the air for about three more. In print, the left panel shows everyone's path from the snap and the right panels close in on the landing spot as the ball comes down and arrives (faint tails show the last second of movement). The receivers' plan is less 'catch it' than 'touch it': one man (Y) goes up for it, and the others position themselves in front of and behind him for a tip.

How often does it work? Over the last ten regular seasons, throws of 35-plus air yards from 40 or more yards out in the last eight seconds of a half, the play-by-play's best proxy for a Hail Mary, numbered 217. They produced a touchdown 6% of the time and an interception 20% of the time.¹⁵ One in seventeen sounds hopeless, but the alternative at 0:04 is zero, and the interception on the last play costs nothing. (At the end of the *first* half it can: a team that throws a Hail Mary from its own 40 is risking very little, but one from deep in its own territory can be returned.)

The prevent defense

The defense's mirror image is the **prevent defense**: rush three (sometimes four), drop eight, and play everyone deep, conceding the short completion in order to take away the long one and tackle in bounds.

¹⁵Course calculation from nflverse play-by-play, 2016–2025 regular seasons: pass attempts in the second or fourth quarter with 8 seconds or fewer left in the half, from 40 or more yards from the end zone, with 35 or more air yards (or air yards not recorded). The proxy catches some ordinary deep shots and misses some Hail Marys thrown short of 35 air yards.

A. Punt from your own end zone

B. Take the safety, then kick from the 20

Figure 9: The intentional safety, as a trade. Top: punting from your own end zone (ball at the 2). The punter stands at the end line, the rush has its shortest path to him, and after the kick and return the opponent's drive starts, at the median of 2015-2025 punts from inside the 5, near midfield in the punting team's territory (marked; course calculation). Bottom: taking the safety instead. The punter runs out of the end zone (two points to the opponent, and several seconds off the clock); then the safety kick, from your own 20 with the 2026 kickoff alignment, has to reach the landing zone (the opponent's 20 to its goal line) and is returned to about the receiving team's own 35 (median, marked). The safety buys about 20 yards of field position and removes the block-and-return risk, for two points.

In field position alone, the swap is worth about 20 yards, and it also removes the chance of a blocked punt. The arithmetic only works with a lead of **three or more** (a safety must not tie the game) and when the clock is nearly gone, so the opponent's drive after the kick is short. The best-known example is the Ravens' in Super Bowl XLVII, covered in Downs, Distance, and Field Position. The boldest came earlier. On *Monday Night Football* in November 2003, Bill Belichick's Patriots trailed Denver 24–23 with 2:51 left and fourth down at their own 1. Long snapper Lonie Paxton snapped the ball through the end zone on purpose: 26–23 Broncos. The free kick from the 20 pushed Denver back to its own 15; New England used two timeouts to force a three-and-out, got the ball back at its own 42 after the punt, and Brady threw the winning touchdown to David Givens with 36 seconds left.¹⁶ Belichick had paid two points to swap the worst field position in football for a defensive stand and a short field. Modern teams use the simpler version in the final seconds: the Chiefs took one with 15 seconds left in a January 2025 divisional-round win over Houston, and the Eagles with six seconds left against Tampa Bay in 2025.¹⁷

¹⁶nflverse play-by-play, game 2003_09_NE_DEN (November 3, 2003): fourth-and-10 at the New England 1 at 2:51, "(Punt formation) ... 66-L.Paxton FUMBLES at NE 0, ball out of bounds in End Zone, SAFETY" (Denver 26–23); the free kick from the 20; New England timeouts at 2:41 and 2:31; Denver's punt; Brady's 18-yard touchdown pass to David Givens at 0:36; Patriots 30, Broncos 26.

¹⁷nflverse play-by-play: game 2024_20_HOU_KC (January 18, 2025), "(Punt formation) 14-M.Araiza right end ran ob in End Zone for –18 yards, SAFETY" at 0:15 with Kansas City leading by 11; game 2025_04_PHI_TB, "(Punt formation) 10-B.Mann right end tackled in End Zone for –34 yards, SAFETY" at 0:06 with Philadelphia leading by 8. The field-position comparison in the plate is a course calculation from 2015–2025 regular seasons: punts from the punting team's 1- to 4-yard line ($n = 245$) and free kicks from the 20 after a safety ($n = 280$), taking the yard line of the receiving team's first snap; the safety-kick rules are NFL Rulebook (2026), Rule 6, Section 1, Articles 1(b) and 2 (a safety kick may be a punt, drop kick or place kick, from the kicking team's 20, with the kicking team's other players on the receiving team's 40), and Rule 6, Section 2, Article 4 (a safety kick out of bounds or short of the landing zone gives the receiving team the ball 30 yards from the spot of the kick).

Sidebar plate: the fair-catch kick

After any fair catch, the receiving team may choose a **fair-catch kick** instead of a snap: a place kick (no tee) or a drop kick for three points, taken *from the spot of the catch*, with the defense lined up ten yards away. There is no snap, no holder seven yards back, and no realistic rush. Two details make it interesting. The kick is eight yards shorter than a field goal from the same line of scrimmage (spot plus 10 for the end zone, instead of plus 18), and the period can be **extended** for it: if time runs out during the punt on which the fair catch is made, the receiving team may still take the kick.¹⁸

Figure 10: The fair-catch kick, as Cameron Dicker made it for the Chargers on December 19, 2024. Denver punted from deep in its own end with eight seconds left in the first half; the Chargers fair-caught the ball, and a 15-yard foul on the punting team for interfering with the fair catch moved the spot to the Denver 47 as time expired. The Chargers chose the fair-catch kick: the holder put the ball down at the 47 itself, the defense lined up 10 yards away, and Dicker's kick needed to travel $47 + 10 = 57$ yards. A field goal from a snap at the same line would have been a 65-yarder.

Dicker's 57-yarder was the first successful fair-catch kick in the NFL since 1976. Attempts are rare because the circumstances are: the fair catch has to come near the end of a half (otherwise the team would rather keep the drive alive) and close enough for a 55- to 65-yard kick. But with modern kickers making long field goals routinely, coaches now keep it on the end-of-half card, and you should too. Watch for a punt from deep in a team's own territory in the last ten seconds of a half: if the returner signals for a fair catch near midfield, the kicking unit may run on with no snapper.

Fourth down: the go-for-it decision

For most of NFL history, fourth down was a kicking down. Inside field-goal range you kicked; outside it you punted; you went for it on fourth-and-inches near midfield, or when you were losing late. The **go-for-it decision**, the choice among going for it, kicking and punting, has since become the most visible place where analytics changed football.

The argument is an expected-points argument, and you have the tools for it from Downs, Distance, and Field Position. Take fourth-and-2 at the opponent's 36:

- **Punt**: the opponent takes over somewhere around its own 10, a situation worth a little to it. You've traded a scoring chance for field position.
- **Field goal**: a 54-yarder. Modern kickers make those about 74% of the time (2023–2025); a miss gives the opponent the ball at the spot of the kick, its own 44.
- **Go for it**: teams converted fourth-and-2 58% of the time in 2021–2025. Success keeps a drive alive inside field-goal range; failure gives the opponent the ball at its own 36.

Put values on each outcome and the "go" option usually wins: the gain from converting (a drive that now scores often) is bigger than the cost of failing (the opponent's field position is only somewhat better than after a punt). The economist David Romer made exactly this case in a 2006 paper with a mischievous title, "Do Firms Maximize? Evidence from Professional Football," and

¹⁸NFL Rulebook (2026), Rule 10, Section 2, Article 4 (after a fair catch the receiving team may put the ball in play "by a snap or fair catch kick (drop kick or place kick without a tee) from the spot of the catch"); Rule 11, Section 4, Article 3 (the receiving team's line is 10 yards in advance of the kick; onside-kick formation rules apply); Rule 4, Section 8, Article 2(e)–(f) (the period may be extended for a fair-catch kick). The Dicker kick: nflverse play-by-play, game [2024_16_DEN_LAC](#) (Dec. 19, 2024): the Denver punt fair-caught at the Chargers' 38 with 0:08 left, fair-catch interference enforced 15 yards, and "11-C.Dicker 57 yard field goal is GOOD ... Fair-Catch Kick" at 0:00; Kris Rhim, "Ain't ever seen that': Rare fair catch kick propels Chargers," ESPN (Dec. 20, 2024; the last successful one was Ray Wersching's for San Diego in 1976): https://africa.espn.com/nfl/story/_/id/43068684/obscure-rule-leads-chargers-making-nfl-first-fair-catch-kick-1976. Unsuccessful attempts in the play-by-play include Phil Dawson's 71-yarder for San Francisco (2013) and Joey Slye's 60-yarder for Carolina (2019).

concluded that NFL teams punted and kicked far more often than the numbers justified.¹⁹ For a decade coaches mostly ignored him. Then the data went public, a generation of analysts built fourth-down models (Ben Baldwin’s open model and its bot, which grades every fourth down live, is the best known), and teams hired their own analysts.²⁰ The modern decision tools use **win probability** (the chance of winning the game from this score, clock and field position), not just expected points, so they know when the score makes a field goal worth more than its three points. That model is built in Win Probability and Decision Analysis; this chapter sticks to what the decisions look like and why they changed.

Figure 11: How often NFL teams went for it on fourth down, 2010-2025 regular seasons: all fourth downs (punts, field-goal tries and plays that went for it, including fakes), and the neutral ones, in the first three quarters with each team’s win probability between 20% and 80%, where the decision is a choice rather than desperation. The neutral rate hovered around 5-8% through 2017, climbed to about 15% by 2021, dipped in 2022-2023, and reached about 17% in 2025. Fourth downs wiped out by a pre-snap penalty are not counted. Source: nflverse play-by-play.

The neutral go rate more than doubled, from 6% in 2010 and 7% in 2017 to 17% in 2025; across all fourth downs it went from 13% to 23%. The turn came in 2018, the season after Doug Pederson’s Eagles won a Super Bowl with fourth-down conversions in the biggest moments, including the “Philly Special” touchdown on fourth-and-goal in Super Bowl LII.²¹ It is tempting to tell the story as one coach and one trick play. The truer story is the slow arrival of evidence: public models, analysts on every staff, owners asking questions, and a generation of head coaches who had grown up with the arguments.

Where did the extra attempts come from? Not from fourth-and-long in your own territory, which still almost nobody tries. They came from short yardage around midfield, where teams used to punt, and from short yardage inside field-goal range, where they used to kick. The fringe just outside kicking range, which Early Downs and Field Zones calls **four-down territory**, already saw teams go on fourth-and-1 and 2 a decade ago; the change there is on fourth-and-3, where the go rate roughly doubled.

¹⁹David Romer, “Do Firms Maximize? Evidence from Professional Football,” *Journal of Political Economy* 114, no. 2 (2006): 340–365. <https://doi.org/10.1086/501171>

²⁰Ben Baldwin, *nfl4th* (open-source fourth-down decision model, R package and public app, 2020–): <https://github.com/nflverse/nfl4th>; the package site, with Baldwin’s methodology and research notes (“4th down research”): <https://www.nfl4th.com/articles/4th-down-research.html>. Go rates and conversion rates in this section are a course calculation from nflverse play-by-play, regular seasons: fourth downs with `play_type` of run, pass, punt or field goal (so a fake punt counts as going for it and pre-snap penalties are excluded); conversions use `fourth_down_converted`.

²¹“Super Bowl LII,” Wikipedia (Eagles 41, Patriots 33, February 4, 2018; the “Philly Special” touchdown pass from Trey Burton to Nick Foles on fourth-and-goal from the 1 before halftime, and Foles’s fourth-and-1 completion to Zach Ertz on the go-ahead drive): https://en.wikipedia.org/wiki/Super_Bowl_LII

Go-for-it rate (%), first three quarters

Figure 12: Go-for-it rate by yards to go and field position, first three quarters only (so that late-game desperation doesn't count), 2010-2012 versus 2023-2025 regular seasons. Each cell shows the share of fourth downs on which the offense went for it; cells with fewer than 15 fourth downs are left blank. The biggest changes are on short yardage (fourth-and-1 to 4) between your own 40 and the opponent's 40, and inside field-goal range, where fourth-and-1 and 2 used to mean a kick. The opponent's 30-39, too far for an easy kick and too close for a good punt, was already a go zone on fourth-and-1 a decade earlier. Fourth-and-long in your own half barely moved. Source: nflverse play-by-play.

Fourth-down rules of thumb

You don't need a model to make a decent call from the couch. These heuristics agree with the public models in most situations, for an average offense and kicker, with the score close and plenty of time left:

- **Fourth-and-1: go almost anywhere past your own 30**, and in many models even deeper. Teams converted 68% of fourth-and-1s in 2021–2025 (this includes the QB sneak and tush push, which convert more often still).
- **Fourth-and-2 or 3: go from about midfield in**. Conversion rates were 58% and 50%.
- **The opponent's 30 to 40 is the “go zone.”** It is too far for a sure field goal and too close for a good punt (a punt from the 35 nets only about 25 yards, and 15 if it bounces into the end zone), so even fourth-and-4 or 5 (converted 50%) is usually a go there.
- **Inside the opponent's 5: go on fourth-and-goal from the 1 or 2** unless the score says three points matter more than seven. A failed try still leaves the opponent pinned at its own goal line.
- **Long yardage in your own half: punt**. Fourth-and-6 to 10 converts only about 34% of the time, and failure gives the opponent a short field.
- **Then let the score and clock override everything**. Trailing late, go more; leading late, the value of the clock (and of making the opponent need two scores) can flip a go into a kick.

Two things these rules leave out are what make real decisions hard: **your** offense and kicker are not average, and the opponent's offense matters (if they score at will, possessions are worth more, so go). That's why two smart coaches can disagree about the same fourth down.

Common misconception

“Going for it and failing proves it was the wrong call.” A fourth-and-2 that converts 58% of the time fails 42% of the time; a good decision loses a lot of coin flips. Judge the decision by the odds at the moment it was made, not by the result, and judge a coach’s fourth-down record by hundreds of decisions, not by the one on Sunday night. (The reverse is also true: a punt that “worked” was not necessarily right.)

Film room: Lions 2021-2025, Dan Campbell’s fourth downs

No coach has been more associated with fourth-down aggression than Dan Campbell, hired by Detroit in 2021. In the first three quarters of games from 2022 to 2025, the Lions went for it on 28% of their fourth downs, the highest rate in the league (the league average was 15%; next were the Eagles at 20%), and they led the league in that rate in four of the five seasons from 2021 to 2025.²² Campbell made aggression part of the team’s identity from his first season, and for most of those seasons the conversions and points it produced were part of why Detroit’s offense was one of the best in football.

The game everyone remembers went the other way. In the NFC Championship Game on January 28, 2024, at San Francisco, Detroit led 24–7 at halftime. Midway through the third quarter, leading 24–10, the Lions went for it on fourth-and-2 from the 49ers’ 28, inside field-goal range, and threw incomplete. Late in the game, trailing 27–24, they went for it on fourth-and-3 from the 30, again in range for a tying kick, and threw incomplete again. San Francisco scored after both, and won 34–31.

What to notice: those were exactly the kind of calls the heuristics call close, a short fourth down at the edge of field-goal range, with a strong kicker available. Reasonable people (and models) disagreed about them before the snap; after the snap, the results made them look like blunders. The fair evaluation is the whole record, and on the whole record Detroit’s aggression was a net positive for years. The lesson for a viewer is to separate the decision from the dice, and to notice that the most aggressive coach in the league still faced exactly the trade-off this chapter describes, possessions against points, every week.

Two-point decisions and the two-point chart

After a touchdown the scoring team chooses between the extra point (a 33-yard kick since the league moved it back in 2015) and a two-point conversion (one play from the 2). Since 2015 the kick has been good 94.3% of the time and the two-point try has succeeded 48% of the time, so the expected points are almost the same: 0.94 for the kick, 0.95 for the try.²³ When two choices are worth the same on average, **the score decides**. That’s the job of the **two-point chart**: a table, keyed by the margin right after the touchdown, of when two points are worth more than one. Coaches have carried versions of it for half a century; the NFL added the two-point try in 1994.²⁴

²²Course calculation from nflverse play-by-play, regular seasons, first three quarters. NFC Championship sequence from nflverse play-by-play, game 2023_21_DET_SF (January 28, 2024): fourth-and-2 at the San Francisco 28 at 7:03 of the third quarter (Detroit leading 24–10), fourth-and-3 at the 30 at 7:38 of the fourth (trailing 27–24), both incomplete; 49ers 34, Lions 31.

²³Course calculation from nflverse play-by-play, 2015–2025 regular seasons (extra_point_result, two_point_conv_result). The extra point was moved back to the 15-yard line (a 33-yard kick) in 2015; teams went for two 58 times in 2014, 94 in 2015 and 128 in 2025. See Field Goals, Extra Points, and the Punting Game for the 2015 rule.

²⁴The two-point conversion entered college football in 1958 and the NFL in 1994 (the AFL used it from 1960 to 1969): “Two-point conversion,” Wikipedia: https://en.wikipedia.org/wiki/Two-point_conversion. The best-known coaches’ chart is credited to Dick Vermeil, who drew it up in the early 1970s as an assistant at UCLA for head coach Tommy Prothro: Michael Lombardi, “Conversion confusion: When going for two, wait ‘til the fourth,” NFL.com: <https://www.nfl.com/news/conversion-confusion-when-going-for-two-wait-til-the-fourth-09000d5d8230f221>; see also FiveThirtyEight, “Dick Vermeil Retired A Decade Ago. Will You Please Stop Using His Damn 2-Point Conversion Chart?”: <https://fivethirtyeight.com/features/dick-vermeil-retired-a-decade-ago-will-you-please-stop-using-his-damn-2-point-conversion-chart/>

Figure 13: A simple two-point chart for late in a game, when only one or two more scores are likely. Find the margin right after the touchdown, before the try. ‘Go’ (blue) means two points turn the margin into a better number: tying (down 2), making a field goal enough to tie (down 5), keeping it a one-score game (down 10), or forcing the opponent to need more than one kind of score (up 1, 5 and 12). ‘Kick’ (grey) means the extra point is as good or better. ‘Close’ (yellow) cases depend on the time left and the two teams. Down 8, the most debated case, is explained in the text. Earlier in a game, kick unless you think your two-point play beats 50%.

The logic in each “go” box is the same: does two points move the margin across a line that matters? The lines are the numbers the other team can reach in one possession, 3 (a field goal) and 7 or 8 (a touchdown with a kick or a two-pointer).

The famous modern case is **trailing by 8 after a touchdown**, which happens when you were down 14 and score. The traditional answer was “kick, cut it to 7, and hope for another touchdown and overtime.” The analytics answer is “go for two *now*.” Make it (about half the time) and you trail by 6, so your next touchdown and extra point win the game in regulation. Miss it and you trail by 8, so you need a touchdown and a two-pointer to tie, but you *know* that now and can plan the rest of the game around it. Over the two touchdowns, going early wins outright about half the time you get both scores and goes to overtime some of the rest; kicking twice almost always goes to overtime, a coin flip. With a two-point success rate near 48%, going early wins about 60% of the games in which you score both touchdowns, against about 50% for kicking, and it also tells you before the last drive what you need.

Like the fourth-down rules, the chart assumes few scores remain. Early in a game, with many possessions to come, the margin will change again before it matters, so teams simply take the better expected value, which since 2015 has been close to a tie. A team with a great short-yardage offense (the Eagles of the tush-push era, for example) should go for two more often than the chart says.

Overtime

The **overtime rules** have changed more in the last fifteen years than almost any other part of the game, and the reason is visible in one game. Under the old sudden-death rule (in the regular season from 1974), the first team to score in overtime won. That gave a big edge to the team that won the coin toss, and the edge grew as offenses improved. The league chipped away at it: in 2010 (playoffs) and 2012 (regular season) a field goal on the first possession no longer ended the game, but a touchdown still did; in 2017 regular-season overtime was cut from 15 minutes to 10.²⁵ Then came the January 2022 divisional-round game in Kansas City, the “thirteen seconds” game covered in *The Game in Fifteen Minutes*: the Chiefs won the toss, drove for a touchdown, and Josh Allen never touched the ball. That spring the league changed playoff overtime so that **both teams get a possession**. In 2025 it extended the rule to the regular season.

²⁵NFL Football Operations, “Overtime rules” and “Featured rules” (2025 regular-season change; 2022 playoff change after the January 2022 Bills–Chiefs game; 10-minute regular-season period since 2017): <https://operations.nfl.com/rules-officiating/featured-rules>; the history (sudden death in the regular season from 1974; the modified rule in the 2010 playoffs and 2012 regular season): “Overtime (sports): American football,” Wikipedia: [https://en.wikipedia.org/wiki/Overtime_\(sports\)#American_football](https://en.wikipedia.org/wiki/Overtime_(sports)#American_football); the 2017 cut to 10 minutes was approved by the owners on May 23, 2017: NFL.com, “NFL owners approve shortening overtime to 10 minutes”: <https://www.nfl.com/news/nfl-owners-approve-shortening-overtime-to-10-minutes-0ap3000000810488>

Figure 14: NFL overtime as of the 2026 season. A new coin toss; the winner usually chooses to receive or kick. Both teams are guaranteed one possession (the kickoff itself counts as the receiving team's chance), except that a safety by the kicking team on the first possession ends the game. After both have had the ball, the team ahead wins; if it is still tied, the next score of any kind wins. The regular season and the playoffs differ in what happens when time runs out: the regular season has one 10-minute period and can end in a tie (two timeouts each), while the playoffs play as many 15-minute periods as needed (three timeouts per 'half' of two periods).

The details are in the rulebook's Rule 16; the strategy follows from three facts.²⁶

Second possession is information. The team that gets the ball second knows exactly what it needs. If the first team kicked a field goal, the second can use all four downs in its own territory, because a punt is no longer an option worth taking. If the first team scored a touchdown, the second must too, and then decide whether to kick and play on or go for two and win on the spot.

First possession is a potential third possession. If the game is still tied after both teams have had the ball, the next score wins, and the team that received first is the one most likely to get the ball next. In the playoffs, with unlimited time, that potential third possession has real value; in the regular season's 10-minute period, it often never comes.

The clock is a weapon in the regular season. Ten minutes is short. A first team that drives slowly for a field goal can leave the second team with four or five minutes and the need for points; a long drive by the second team can run the clock out, and the game ends in a tie.

That is why there's no consensus on whether to receive. Analytics researchers still tend to find a small edge in **receiving**, mostly because of that possible third possession; many coaches and former players on television prefer **kicking off**, for the information and the free use of fourth down. The edge either way is small, it depends on the two offenses, and the regular season's 10-minute clock makes the third possession less likely.²⁷

²⁶NFL Rulebook (2026), Rule 16, Section 1: Article 3 (regular season: one 10-minute period, both teams must have the opportunity to possess unless the kicking team scores a safety on the receiving team's first possession, two timeouts each, a tie if still level), Article 4 (postseason: 15-minute periods until there is a winner, three timeouts per half), Article 5(c) (the kickoff is the receiving team's opportunity to possess) and 5(d) (no coaches' challenges; the replay official starts all reviews).

²⁷David K. Li, "The NFL's overtime can still come down to a coin toss. Is it better to kick or receive?" NBC News (September 20, 2025); Ron Yurko of Carnegie Mellon's Sports Analytics Center, "I would take the ball, at least that's what the current evidence suggests," an edge "smaller than it was" under sudden death; NBC's Chris Simms and Fox's Greg Olsen favouring kicking off: <https://www.nbcnews.com/sports/nfl/nfls-overtime-can-still-come-coin-toss-better-kick-receive-rcna231812>

i Film room: Chiefs 2023 season — Super Bowl LVIII overtime

Super Bowl LVIII was the first Super Bowl played under the 2022 playoff overtime rule (and only the second to reach overtime at all, after LI). After Butker's tying kick (see the timeline earlier in the chapter), San Francisco won the coin toss and chose to **receive**. It drove from its own 25 to the Kansas City 9 over more than seven minutes and kicked a 27-yard field goal: 22–19.

Now Kansas City knew everything. A field goal would tie and send the game to sudden death; a touchdown would win. On fourth-and-1 at its own 34, with the season on the line, the Chiefs went for it (a punt would have meant that any San Francisco score won the game), and Mahomes ran for eight yards. On third-and-1 at the 49ers' 32 he scrambled for 19 more. The drive ended with a three-yard touchdown pass to Mecole Hardman with three seconds left in the first overtime period: 25–22, Kansas City.

What to notice: the 49ers' choice to receive, debated for weeks afterwards, followed the old sudden-death instinct. Under the new rule a first-possession touchdown no longer ends the game, so receiving first mainly bought San Francisco a *possible* third possession; it also meant the 49ers drove without knowing what they needed, and settled for three points. Deferring would have handed that information to them. Notice too how the second team plays four-down football from its own 34: the rule changed what fourth down means.

Film room: the clock manager's reputation

i Film room: Chiefs 2015 season — the slow drive at Foxborough

Andy Reid is now remembered for one of the best two-minute offenses in football, but for most of his career “clock management” was the phrase his critics reached for. The two examples you'll hear most:

- **Super Bowl XXXIX (2004 season).** Reid's Eagles trailed New England 24–14 with 5:40 left and the ball. They drove for a touchdown, but the drive took 3:52 of clock, with the clock running between many of the snaps, and the Eagles held two timeouts the entire way. They scored with 1:48 left, failed on the onside kick, and got the ball back only at their own 4 with 46 seconds left.
- **AFC Divisional Round, January 16, 2016 (2015 season).** Reid's Chiefs trailed the Patriots 27–13 and took over at their own 20 with 6:29 left. The touchdown came with 1:13 left: a 16-play drive that used **5:16**, with the clock running between many of the snaps and all three timeouts unused. The onside kick failed, and New England knelt out the game.²⁸

What to notice: both drives *scored*. The problem was the price. Trailing by two scores, a team needs two possessions, and the second one has to come from the time the first one leaves. In the price list from the top of the chapter, the difference between huddling (40-odd seconds a play) and hurrying (about 20) over 13 or 16 plays is four or five minutes, roughly the time the second possession needed.

The postscript is the more interesting part. The Chiefs of the Mahomes era made the clock their weapon: the thirteen-seconds game, the Super Bowl LVIII regulation drive charted above, and a long run of end-of-half scores. The coach was the same; the quarterback, the play design, and the team's investment in game management were not. Reputations in this area lag reality by years in both directions.

Coach the clock: one flowchart

Everything above compresses into a handful of questions a team asks after every play in the last two minutes. The chart below is the version to keep in your head on Sunday.

²⁸nflverse play-by-play: game [2004_21_NE_PHI](#) (Super Bowl XXXIX, February 6, 2005), Philadelphia's possession from its own 21 at 5:40 to Greg Lewis's 30-yard touchdown at 1:55 (extra point at 1:48), with the Eagles holding two timeouts throughout; game [2015_19_KC_NE](#) (January 16, 2016), Kansas City's possession from 6:29 (trailing 27–13) to Charcandrick West's 1-yard touchdown at 1:18 (extra point at 1:13), with all three timeouts unused, followed by a recovered onside kick by New England and three kneels.

Figure 15: A clock decision flowchart for the last two minutes of a half. Left: the team with the ball needs points and time. After each play, first ask whether the clock is running; if it is, decide how much the next snap is worth and choose the cheapest stoppage that gets it (a hurry-up snap, a spike that spends a down, or a timeout that spends a timeout). Right: the team with the lead and the ball spends time instead, and the trailing defense's main tools are its timeouts (or, when it is behind by more than a score with time running out, letting the offense score to get the ball back). The bottom row is the end of the line: kneel when the arithmetic works, take the field goal with the clock stopped, or throw the Hail Mary when there is only one snap left.

Watch for it on Sunday

💡 Watch for it on Sunday: coach the clock

In the last two minutes of each half, call the clock decision before the team makes it. Keep three numbers in your head from the score bug: time left, each team's timeouts, and the yard line versus field-goal range (add 18).

- **After every play, say “running” or “stopped”** before the broadcast tells you, and remember the out-of-bounds rule only bites after the first-half two-minute warning and in the last five minutes.
- **Trailing offense, clock running:** predict hurry-up, spike or timeout. Spike on first or second down with time for more plays; timeout when there's time for only one or two, or when the kicking unit has to come on.
- **Watch the receivers' feet.** On a sideline catch, does he get out, or turn upfield for two more yards? Did the defender push him out (a gift) or tackle him in bounds (a win for the defense)?
- **Leading team with a first down:** do the kneel math (about 2:03 with no defensive timeouts, 40 seconds less per timeout). If it works, call the victory formation before it lines up.
- **Trailing defense:** predict when it calls timeouts. A good one calls them right after the leading team's first-down and second-down runs, not at the end.
- **Fourth down before the snap:** go, kick or punt? Use the heuristics: fourth-and-1 almost always go; opponent's 30 to 40 is the go zone; long yardage in your own half, punt.
- **After a touchdown late:** find the margin and check the two-point chart (down 2, 5, 8 or 10; up 1, 5 or 12: expect them to go).
- **At the end of the first half:** who receives the second-half kickoff? That team will push harder for a late score.

Predict the play

💡 Predict the play 1: spike or snap?

Figure 16: Fourth quarter, 0:31 and running. The offense trails 20-18 and has no timeouts. It just completed a 12-yard pass to the opponent's 26 (first-and-10), and the receiver was tackled in bounds; the offense is sprinting back to the line. Its kicker is good from about 50 yards. A field goal from here would be a 44-yarder.

Spike now, or snap a real play? And what has to be true before the field goal?

Answer 1 is at the end of the chapter. Try it first.

💡 Predict the play 2: can they kneel it out?

Figure 17: Fourth quarter, 1:40 and running, after a first-down run. The offense leads 24-20 with first-and-10 at its own 35, and is jogging back to the line with a fresh 40-second play clock. The defense has one timeout left. The two-minute warning has already passed.

Can the offense kneel three times and end the game? What should the defense do with its timeout?

Answer 2 is at the end of the chapter. Try it first.

💡 Predict the play 3: fourth-and-2 at the 36

Figure 18: Second quarter, 6:00 left, tied 10-10. The offense faces fourth-and-2 at the opponent's 36 (yellow line: the line to gain). It has kept its regular 11-personnel offense on the field; the defense is in its nickel package with a two-high shell. A field goal from here would be a 54-yarder; the kicker's career long is 55.

Punt, kick or go? What does the offense's personnel tell you about the decision it has already made?

Answer 3 is at the end of the chapter. Try it first.

Takeaways

- **The clock is a currency.** Late in a half the trailing team wants plays per second and the leading team wants seconds per play. Price every play: an incompletion or a catch out of bounds costs about 5–6 seconds, a catch in bounds about 21, unless a spike (a down) or a timeout pays for it.
- **Out of bounds stops the clock until the snap only late:** after the two-minute warning of the first half and in the last five minutes of the game. The **10-second runoff** punishes an offense that stops the clock illegally, and can end a half.
- **The two-minute drill** throws outside, avoids sacks, spikes on early downs and saves timeouts for the end. **The four-minute offense** does the opposite: runs inside, snaps at the end of the play clock, and treats first downs, not points, as the goal. Three kneels drain about two minutes, minus about 40 seconds per defensive timeout.
- **End-of-half calls** weigh points against the risk of a short field for the opponent. The **prevent defense** is right only when the clock makes yards cheap; the **Hail Mary** scores about one time in seventeen. The **intentional safety** and **fair-catch kick** are rare but decide games.
- **Fourth down became a decision:** the neutral go rate more than doubled from 2017 to 2025. Fourth-and-1 is almost always a go, the opponent's 30–40 is the go zone, and good decisions still fail often.
- **Two points and overtime follow the score.** The two-point chart asks whether two points cross a line that matters (down 2, 5, 8, 10; up 1, 5, 12). Overtime gives both teams a possession; the second team plays with information, the first with a possible third possession.

Connections

Builds on: The Game in Fifteen Minutes (when the clock runs and stops, timeouts, the two-minute warning, the “thirteen seconds” game); Downs, Distance, and Field Position (expected points and the Super Bowl XLVII safety); In-Game Adjustments and Tempo (tempo and the hurry-up); Field Goals, Extra Points, and the Punting Game (field-goal range, the extra point and the fair catch); Kickoffs, Returns, and the Dynamic Kickoff (the safety kick's alignment, squib and onside kicks late in games); Officiating, Replay, and the Rules of the Ball (grounding and late-game replay); and Red Zone, Goal Line, Two-Point Plays, and Short Yardage (the plays behind fourth-and-short and two-point decisions).

Sets up: Win Probability and Decision Analysis, which builds the model behind every fourth-down, two-point and timeout decision here; The Lions: Ben Johnson's Offense and Dan Campbell's Aggression, the full case study of the most aggressive fourth-down

team of the era; Reid's Chiefs, where the two-minute offense is part of the system; and Watching Live, where the clock checklist joins the pre-snap one.

Go deeper

- The **NFL Rulebook** (NFL Football Operations, free online): Rule 4 (game timing, including Sections 3, 4 and 7 on starting and stopping the clock and the runoff), Rule 8, Section 2 (grounding and the spike), Rule 10, Section 2 and Rule 11, Section 4 (the fair-catch kick) and Rule 16 (overtime).
- David Romer, "Do Firms Maximize? Evidence from Professional Football," *Journal of Political Economy* (2006): the paper that started the fourth-down argument, readable without the equations.
- Ben Baldwin's open-source **fourth-down model** (the [nfl4th](#) package and its public site) for go/kick/punt and two-point recommendations on any fourth down or try.
- **nflverse play-by-play** (via [nflreadpy](#)): every snap since 1999 with the game clock, timeouts, spikes and kneels, so you can rebuild every chart here and audit your own team's clock management.

Answers to Predict the play

Answer 1.

Spike, then take one quick shot toward the sideline, then kick with the clock stopped. The key fact is the one at the end of the question: **the field-goal unit realistically can't run on and set up while the clock is running**, and with no timeouts the only ways to stop it are an incompletion, getting out of bounds, or a spike. So the offense must not let a play end in bounds without a plan.

Price the options. Lining up and spiking costs about 16 seconds from the last snap, counting from the completion's snap a few seconds before 0:31, so the clock stops at about 0:20 and it's second-and-10. That leaves time for one more snap that ends with the clock stopped (an out route or a throwaway), and then the kick. Running a real play instead is a gamble: a catch in bounds at, say, the 18 would leave the offense needing to spike with the clock still running and perhaps ten seconds left, which is fine; a sack or a run stuffed in bounds would end the game. Coaches with no timeouts take the cheap, certain stoppage first. (If the offense *had* a timeout, it would save it for the kick and still spike now.)

Answer 2.

Yes: three kneels end it, and the timeout can't stop that. Work the arithmetic from the kneel chart. Kneel 1: the offense lets the play clock run, snaps at about 1:01 and the kneel ends at about 0:59. The defense calls its timeout. Kneel 2 starts the clock on the snap and ends at about 0:57. With no timeouts left, the play clock runs again: kneel 3 at about 0:18, ending around 0:16. Now it's fourth down with 16 seconds left and a 40-second play clock, so the game clock reaches zero before the offense has to snap again. Game over, without a fourth-down play.

That's why the chart says one timeout is worth only about 40 seconds: the defense needed **two** timeouts here (or the two-minute warning still to come) to force a fourth-down snap. It doesn't matter when it calls the one it has; any order gives the same arithmetic. Its only real hope is a fumbled snap, which is exactly what the victory formation, drawn here, is built to prevent.

Answer 3.

Go for it, and the offense has told you so by leaving its offense on the field. By every rule of thumb in the chapter, this is a go: fourth-and-2 converts about 58% of the time; the 36 is in the opponent's 30-to-40 "go zone", where a punt nets only about 25 yards and a 54-yard kick near this kicker's limit misses often (the league made 50- to 54-yarders 74% of the time in 2023–2025, and a kicker near his career long will do worse) and hands the opponent the ball at its own 44. In 2023–2025, teams in the first three quarters went for it on 57% of fourth-and-2s between the opponent's 31 and 40, against 36% in 2013–2015.

The pre-snap clue is the personnel: no punter or kicker jogging on, the regular offense lined up with the quarterback in the shotgun. Some teams line up to go and then take a delay-of-game penalty or call a timeout if they can't draw the defense offside, so wait for the snap; but a team that keeps 11 personnel on the field on fourth-and-2 has made its decision on the sideline. As for the play: expect a quick pass or a run that needs only 2 yards, from the short-yardage menu in Red Zone, Goal Line, Two-Point Plays, and Short Yardage.
