

Case Study: The Ravens' Option Run Game with Lamar Jackson (2019–2025)

How Baltimore turned a quarterback's legs into an extra blocker on every snap, what it won, what defenses did about it, and how the era ended

A Sunday in the fall of 2019. Baltimore breaks the huddle with two tight ends and a fullback. Lamar Jackson stands four yards behind the center, with Mark Ingram directly behind *him*, three yards deeper. The defense has seen the film. It walks a safety down and crowds eight men within a few yards of the ball, the kind of picture a broadcaster calls “selling out to stop the run.” The ball is snapped, Jackson puts it in Ingram’s stomach, and an unblocked defensive end on the edge freezes for half a heartbeat, unsure whether to take the back or the quarterback. Ingram goes for seven. Two plays later, from the same look, the same end crashes on Ingram, and Jackson is past him and gone for twenty. The defense did what every coaching manual says, loaded the box, and lost anyway. **How do you build an offense where “eight in the box” is not enough, and why did it beat the NFL for five years and then, in the games that mattered most, too often come up short?** This chapter is that story, told as a closed era: the 2019–2025 Ravens, from Greg Roman’s rebuild to John Harbaugh’s firing in January 2026.

You’ll be able to:

- Explain the four pieces of Greg Roman’s 2019 design (heavy personnel, the pistol, a menu of option reads, designed quarterback runs) and what problem each one solved.
- Count a Ravens run the way their opponents had to: blockers, plus the quarterback as a runner, against defenders in the box, and say where the defense’s extra man has to come from.
- Recognize the signature plays (the pistol inverted veer, the 13-personnel sets, the QB counter) from the formation and the first step of the line.
- Read the era’s data fingerprint (rushing EPA against the league every season, Jackson’s designed runs, the pistol and under-center shares) and say what changed under Todd Monken in 2023 and with Derrick Henry in

2024.

- Describe the defenses’ answers (speed, deficits, pressure, spies) and judge the “can’t win in the playoffs” argument with the numbers rather than the narrative.

You’ll need

- **Option Football:** the read key, give and keep, the zone read, the inverted veer (power read), and designed quarterback runs (QB power, QB counter) as a way to turn the running back into a blocker. This case study assumes you can tell those apart.
- **Run Fits: Gap Integrity, Force, Spill, and Box Math:** every gap owned exactly once, the **plus-one** (one more run defender than the offense has blockers), and the rule “count the quarterback as a blocker when he reads.”
- **The Modern Era:** the league these Ravens played in, from the 2018 passing boom to the two-high defenses and the return of heavy personnel and under-center snaps by 2025.
- Also useful: EPA and success rate (the numbers in the data section) and Personnel Groupings (what “12” or “13 personnel” means).

How to read the diagrams. Offense is blue circles, defense orange squares; *left* and *right* mean the offense’s left and right. Q is the quarterback and R the running back; Y and U are tight ends (Y on the right, U on the left) and H a third tight end on the wing. LT, LG, C, RG and RT are the linemen. Defensive linemen are labelled by their technique number (9 is the end man outside a tight end, 5 on a tackle’s outside shoulder, 3 on a guard’s, 1 shaded on the center); M and W are the Mike and Will linebackers, S the Sam, and FS and SS the free and strong safeties. Lines ending in a short bar are blocks, thin arrows are paths without the ball, thick dark arrows are ball carriers, and the **dashed green line from the quarterback is his eyes**: the defender he is reading. Dashed arrows are an option’s *branches*. Rings: **orange** marks the defender to watch, **purple** a blocker to follow, and **green** follows the ball in the animation. Wide receivers who do not matter to the play are left out of the box-sized pictures, and every picture is a typical version of a play, not a copy of a particular Ravens snap.

The problem: a quarterback who didn't fit (2018)

Lamar Jackson arrived in Baltimore with the last pick of the first round of the 2018 draft, 32nd overall, after a Heisman Trophy at Louisville in 2016 and a college career in which he ran for more than 4,000 yards.¹ He also arrived with a question hanging over him that a lot of NFL people asked out loud: could a quarterback who ran like that be a real NFL passer, or would he have to move to another position? The Ravens had a veteran starter, Joe Flacco, a Super Bowl MVP five years earlier, and an offense built for a pocket passer.

Then, in November 2018, Flacco hurt his hip, and on November 18 against Cincinnati Jackson made his first NFL start.² What followed was improvised. The coaching staff didn't have a Jackson offense, so it bolted his college game onto Flacco's: lots of quarterback runs, read plays, extra tight ends, and as few dropbacks as it could get away with. The data shows how sudden the swerve was. With Flacco starting, weeks 1 through 10, the Ravens called a designed run on 34% of their plays; with Jackson starting, weeks 11 through 17, it was 59%, and the runs went from -0.02 EPA per play, slightly worse than an average snap, to +0.08.³ Jackson ran 147 times that season, a record for a quarterback at the time, and Baltimore won six of his seven starts to take the AFC North.

The improvisation had a ceiling, and the wild-card game on January 6, 2019 found it. The Los Angeles Chargers had played Baltimore two weeks earlier, and for the rematch their defensive coordinator, Gus Bradley, did something almost nobody did: he put **seven defensive backs** on the field for 58 of the Ravens' 59 snaps, with two safeties playing linebacker. The Chargers had used seven defensive backs for a total of 50 snaps all season. Their head coach, Anthony Lynn, said later that when Bradley proposed it his first reaction was to ask whether the staff was insane. It wasn't. The Ravens gained 90 rushing yards and 229 in total, the fewest the Chargers had ever allowed in a playoff game, Jackson was sacked seven times, and Los Angeles won 23-17 after leading 23-3 in the fourth quarter.⁴ (Figure 7, later in the chapter, draws the idea.)

The lesson the Ravens took from that afternoon was not "stop running the quarterback." It was that a run game *added on* to an offense is a run game a defense can study, match and outnumber in a week. If Jackson's legs were going to be the foundation, the whole offense had to be built on them, including the passing game, so that the defense's best answer to the run would open something else. That is a design problem, and the man the Ravens handed it to had been working on exactly that problem for most of a decade.

The scheme answer: Greg Roman's 2019 rebuild

In January 2019 the Ravens promoted **Greg Roman**, their assistant head coach and tight ends coach, to offensive coordinator.⁵ Roman had run the 49ers' offense from 2011 to 2014, when Colin Kaepernick's pistol read game took San Francisco to a Super Bowl, and Buffalo's in 2015 and 2016 with another running quarterback, Tyrod Taylor; the Bills led the NFL in rushing yards both of those seasons.⁶ He was, in other words, the league's most experienced designer of run games with a quarterback in them.

His first public description of the plan was blunt. The staff would not try to fit Jackson into something that "other people had once done"; it would "rebuild the thing from the ground up" and build an offense "that really accommodates" him.⁷ What came out of that rebuild had four pieces, and each one answers a specific question the Chargers had asked.

1. Heavy personnel: more blockers, and slower defenders. The Chargers' answer had been speed: little defenders who could run with Jackson. Roman's first move was to make little defenders expensive. The 2019 Ravens put fewer than three wide receivers on the field on 53% of their snaps, against 37% for the league, using tight ends Mark Andrews, Hayden Hurst and Nick Boyle and

¹"Lamar Jackson," Wikipedia: https://en.wikipedia.org/wiki/Lamar_Jackson (Heisman Trophy 2016; drafted 32nd overall in 2018 after the Ravens traded back into the first round; 4,132 college rushing yards at Louisville).

²Flacco's hip injury and Jackson's first start on November 18, 2018, against Cincinnati: "2018 Baltimore Ravens season," Wikipedia: https://en.wikipedia.org/wiki/2018_Baltimore_Ravens_season; the game date is confirmed by nflverse play-by-play (game_id 2018_11_CIN_BAL).

³This book's calculation from nflverse play-by-play, 2018 regular season, Baltimore: designed runs (rushes excluding quarterback scrambles, kneel-downs and botched snaps) as a share of run and pass plays, and their EPA per play, for weeks 1-10 (Flacco's starts) and weeks 11-17 (Jackson's). Jackson's 147 rushing attempts and 695 yards in the 2018 regular season are from the same data.

⁴NFL.com, "Chargers' speedy secret plan stopped Ravens" (January 2019; Next Gen Stats: seven defensive backs on 58 of 59 snaps, 50 such snaps all regular season; Lynn's reaction; 229 total yards, 90 rushing, seven sacks): <https://www.nfl.com/news/chargers-speedy-secret-plan-stopped-ravens-0ap3000001008744>. The score progression is from nflverse play-by-play.

⁵NFL.com, "Roman in as new Ravens OC; Mornhinweg departs" (January 2019): <https://www.nfl.com/news/roman-in-as-new-ravens-oc-mornhinweg-departs-0ap3000001009637>.

⁶Roman's coaching history (49ers offensive coordinator 2011-2014, Bills 2015-2016, back in Baltimore from 2017) is in the NFL.com piece above. The Bills' rushing titles are this book's calculation from nflverse play-by-play: 2,432 rushing yards in 2015 and 2,630 in 2016, first in the league both years.

NFL.com's account of the same period quotes him: "Obviously with Lamar at quarterback, it's going to be tailored towards Lamar": <https://www.nfl.com/news/roman-ravens-offense-to-be-tailored-towards-lamar-0ap3000001017961>.

the fullback (and part-time defensive lineman) Patrick Ricard (02-01 has the personnel fingerprint). Every tight end or fullback is one more blocker on a run, which forces the defense to answer with bigger bodies. Against Baltimore in 2019, defenses were in a **base defense** (four defensive backs, seven bigger front players) on 40% of snaps; against the rest of the league they were in base on 27%.⁸ A linebacker is a better run defender than a safety, but he is a worse chaser of a sprinter-fast quarterback in space, and a much worse cover man against a tight end like Andrews.

2. The pistol: no tell, and both ends in play. The **pistol** (02-02) puts the quarterback about four yards from the ball with the back directly behind him. The Ravens made it their home. In 2019 they lined up in it on 54% of their plays, 558 snaps; the rest of the league combined used it on 3% of plays, and the next-heaviest user had 68 snaps all season.⁹ 75% of Baltimore's designed runs started there. Why the pistol rather than the shotgun? Three reasons, each one a fix for something the shotgun gives away:

- *No directional tell.* In the shotgun the back stands beside the quarterback, and which side he is on usually hints at where the run is going. From the pistol the back can go either way with the same first step, so the defense can't lean before the snap.
- *A downhill back.* A back seven yards deep and straight behind the ball runs at the line with momentum, like a back in the I-formation, instead of starting sideways from the quarterback's hip. That makes gap runs (power, counter, duo) work from the same look as reads.
- *Both ends are read keys.* With the quarterback at four yards and the back behind him, the mesh can go to either side, so either defensive end can be the read key on any snap. A defense that wants to tell its backside end to "always crash" has to tell *both* ends, and an end can't know before the snap which one he is.

3. A menu of reads. On top of the pistol, Roman ran the whole option family that 03-04 teaches, and added a few of his own: the zone read and bash, the inverted veer (power read), the *counter read* (two linemen pull and the backside end is read), *counter bash* (the back goes away from the pullers, the quarterback follows them), and the occasional speed option.¹⁰ The point of having so many is not variety for its own sake. Each one leaves an end alone but sends the runners to different places, so a defense that solves one read with a stunt or an exchange (03-04) is wrong against the next.

4. Designed quarterback runs: the back becomes a blocker. And sometimes there was no read at all. Jackson carried on purpose, on QB power, QB counter, QB draws and sweeps, and on those plays the running back or the fullback became one more lead blocker. In 2019 Jackson had 113 designed runs, about 7.5 a game, averaging 7.4 yards and +0.32 EPA per carry.¹¹

Put those together and you have what this book calls a **pistol option offense: an offense that makes the pistol its base alignment and builds its run game on the quarterback as a runner, with option reads and designed quarterback runs behind extra tight ends and fullbacks, so that the defense must account for one more ball carrier on every snap.** Chris Ault built the college version at Nevada, where the pistol was born in 2005 and Kaepernick learned to run it (03-04 and The College Laboratory tell that story). The 2019–2022 Ravens are the NFL's defining example.

! Why it exists

A pistol option offense exists because **a quarterback who is a real running threat is worth one blocker on every run, and the pistol lets an offense collect that blocker from either side, behind a downhill back, without showing which way it is going.** The heavy personnel makes the defense match with bigger, slower players, and then the passing game punishes the bigger, slower players. The trade is the quarterback's body (he is a ball carrier, or a target, on most snaps), a passing game built from fewer receivers, and a style that works best when the offense is ahead or level, because the run is its engine.

The rebuild worked at once. The 2019 Ravens went 14–2, led the league in scoring with 531 points, set the NFL record for team rushing yards with 3,296, and Jackson ran for 1,206 of them, a quarterback record, while also leading the league with 36 touchdown

⁸This book's calculation from nflverse participation data (Next Gen Stats personnel labels), 2019 regular season: share of Baltimore's run and pass plays with fewer than three wide receivers; share of plays on which the defense had exactly four defensive backs (base), against Baltimore and against all offenses.

⁹This book's calculation from nflverse participation data, 2019 regular season (`offense_formation == "PISTOL"`, Next Gen Stats labels): Baltimore's pistol snaps, the league-wide share, and the next team's count.

¹⁰Mike Santagata, an in-depth look at the Ravens' rushing attack, *Sports Illustrated* All Bengals (October 22, 2021), on the Ravens' power read, counter read and counter bash: <https://www.si.com/nfl/bengals/allbengals-insiders-plus/in-depth-look-at-lamar-jackson-and-the-baltimore-ravens-rushing-attack>.

¹¹This book's calculation from nflverse play-by-play, regular seasons: Jackson's rushes excluding scrambles, kneel-downs, botched snaps and likely sneaks (middle runs with two yards or less to go), per game in which he threw a pass. This is the same definition of a designed quarterback run that 03-04 uses for the league.

passes on his way to a unanimous MVP award.¹² By the measure this chapter uses, Baltimore's designed runs averaged +0.11 EPA per play that season, 1st in the league, while the league as a whole averaged -0.07. The rest of this chapter explains why.

Why the quarterback changes every run fit

Run Fits gave the rule in one line: count the quarterback as a blocker when he reads. It is worth slowing that down, because the Ravens' whole era is an argument about what the rule really costs a defense, and the cost is larger than one man.

Start with a defense's ordinary plan against a run. Every gap has exactly one owner, and the defense tries to have one more run defender than the offense has blockers: the plus-one. Against a quarterback who hands off and watches, the plus-one is easy to find. The offense blocks as many defenders as it has blockers; the one left over is usually the end on the far side of the play, and he can do the most useful thing a free defender can do, chase the play down the line from behind and tackle the back if he cuts back.

Figure 1: One front, two quarterbacks. The same pistol 12-personnel look (two tight ends) against the same eight-man box (shaded), and the same inside-zone run to the right. Left: with a quarterback who only hands off, seven blockers take seven defenders and the backside end (ringed) is the defense's free man; he chases flat down the line and tackles the back on his cutback. Right: with Jackson at quarterback, that end is the read key. If he chases, Jackson keeps the ball and runs where he was; so he has to stay home and play the quarterback, and the cutback lane he would have closed stays open. Seven blockers plus a read against eight: a hat on every hat, and the defense's only spare man is a safety 12 yards away.

Now put Jackson at quarterback (Figure 1, right). Nothing about the blocking changes, but the free man isn't free any more. If the backside end chases the back, Jackson keeps the ball and runs into the space the end just left. So the end has to stay home and play the quarterback, and the moment he does, the defense has lost its plus-one: seven blockers and a read against eight defenders is a hat on every hat. To get the plus-one back, the defense has to bring a ninth defender down, and in Figure 1 the only one left is the free safety, twelve yards deep and the last man in the deep middle.

That is the arithmetic. The Ravens' insight was that the arithmetic doesn't only apply on read plays. It applies on **every** run, for three reasons that compound.

The threat works on plays that aren't reads. Most of the Ravens' runs were simple handoffs. But a backside end can't see the play call. On every pistol handoff he sees the same mesh he sees on a read, and if he chases the back on the one snap in five that was a read, Jackson is gone. So he learns to stay home *every* time, and on the four plain handoffs the offense gets for free what it earned on the read: an end who isn't chasing the cutback. Coaches call this "freezing" the backside, and it is why a quarterback's run threat improves his running backs' numbers even when he never touches the ball.

Every defender's fit gets one more line. A run fit (05-05) is a list of who owns which gap. Against a running quarterback, the defense needs one more owner on that list, *quarterback*, on every play, and the person who owns him can't own anything else. If

¹²NFL.com, "Ravens break single-season team rushing record" (December 2019; 3,296 yards, breaking the 1978 Patriots' 3,165): <https://www.nfl.com/news/ravens-break-single-season-team-rushing-record-0ap3000001092761>; "2019 Baltimore Ravens season," Wikipedia: https://en.wikipedia.org/wiki/2019_Baltimore_Ravens_season (531 points; Jackson's 1,206 rushing yards and 36 touchdown passes; unanimous MVP).

it's the end, he can't squeeze; if it's a linebacker, his gap needs a new owner; if it's a safety, the deep middle does. There is no free version.

Pursuit stops being free. Even after the ball is handed off, a defense normally gets a bonus: everybody on the far side of the play turns and runs to the ball. That backside pursuit cleans up mistakes. Against Jackson, backside defenders who turn and run before they're sure the quarterback doesn't have it get punished by the keep, so they turn a step later, and a step later is the difference between a four-yard run and a twelve-yard one.

🔥 Common misconception

"Loading the box stops a running quarterback." Loading the box is how a defense gets its plus-one against a handoff. Against a quarterback who reads, an eight-man box is a seven-man box, because one of the eight is assigned to the quarterback. The 2019 Ravens faced boxes about as heavy as anyone's (eight or more defenders on 22% of their designed runs, against 21% for the league), and still led the league in rushing efficiency.¹³ The extra defender has to come from somewhere, and when he comes from the deep secondary, the passing game is aimed at the hole he leaves.

Signature play 1: the pistol inverted veer

The play that best shows Roman's design is the inverted veer, the power read, run from the pistol with two tight ends. 03-04 drew it from the shotgun with a slot receiver; the Ravens' version shows what the pistol and the extra tight ends add.

Pistol inverted veer (power read), 12 personnel

Figure 2: The pistol inverted veer (power read) to the right, from 12 personnel against an eight-man box. The line blocks power: the right tight end (Y) blocks down on the 5, the right tackle and right guard double-team the 3 before the guard climbs to the Will, the center blocks back on the 1, and the left guard pulls across for the Mike. On the backside, the left tackle and the other tight end (U) wall off the 5 and the 9. The play-side 9 (ringed), the end man on the line outside the tight end, is the one defender not blocked: Jackson reads him. The back, starting directly behind the quarterback, sweeps right across his face. If the 9 widens with the back, Jackson keeps and runs inside him behind the pulling guard (green); if the 9 squeezes inside, Jackson gives and the back runs outside him (dark). Count the box: seven blockers and a read against eight. The free safety, the only defender left, is 12 yards deep (out of the picture).

Walk through what Figure 2 asks of the defense.

¹³This book's calculation from nflverse play-by-play and participation data (Next Gen Stats box counts), 2019 regular season, designed runs: share facing eight or more defenders in the box, Baltimore against the league. Rows recording fewer than three box defenders are treated as missing.

Before the snap, the defense can't lean. In the shotgun, a back offset to the left usually means a run to the right; from the pistol, the back is straight behind the quarterback and gives nothing away. The defense has to stay balanced: a 9 on each side, a 5 on each side, linebackers over the middle.

At the snap, the line tells a story of power. The tight end and tackle block down, a guard pulls across. Every linebacker in the league has been taught to follow a pulling guard, because on power the puller leads the ball carrier through the hole. Here he does lead a ball carrier through the hole, but which one?

The end man has a bad choice. The play-side 9 is the man the power play would normally kick out or log. On this play nobody touches him. If he does what he's taught against power, *squeeze* the hole from the outside so the pulling guard has nowhere to go, he has stepped inside the back, who is running outside him at full speed with only a safety or corner left to beat. If he widens to take the back, he has opened the hole for the quarterback, who follows the guard through it. Either way the defense's best edge player is blocked by a decision.

Why build it from the pistol with tight ends instead of the shotgun with receivers, as most college teams did? The tight ends do two jobs a receiver can't. The play-side tight end's down block on the 5 creates the hole's inside wall from a tighter angle, so the quarterback's keep lane is a real gap, not a crease. And the backside tight end blocks a man a receiver couldn't: the backside 9, the defender who on a shotgun power read is left to chase the quarterback from behind. With him walled off, **the eight-man box is fully accounted for**, seven blocks and a read, which is the arithmetic of Figure 1 made into a play.

What does it cost? Two things. The back is running sideways on the give, so a wrong read (a give when the 9 was actually widening) loses yards. And the keep sends Jackson between the tackles, where the linebackers and the safety arrive, on every snap that the 9 widens. That second cost is real enough that the Ravens ran the play in measured doses, which brings us to the formation that made the doses unpredictable.

Signature play 2: the 13-personnel sets

The most extreme version of Roman's heavy offense put three tight ends on the field: **13 personnel**, one back, three tight ends and one wide receiver. In 2019 it was a small slice of the Ravens' offense, 57 regular-season snaps, but it is the clearest picture of the bind the whole offense put defenses in, and it hides a surprise.

Figure 3: The 13-personnel bind, as the 2019 Ravens used it (illustrative; in 2019 the three tight ends were typically Mark Andrews, Nick Boyle and Hayden Hurst, with Mark Ingram at running back and the lone wide receiver split wide, out of the picture). Both panels show the same pistol formation, with the U and Y tight ends on the line and H on the wing, against the defense’s usual answer: a base 4-3 with the strong safety walked down, eight in the box (shaded) and one deep safety. Left, the pass: after a run fake, the Y runs up the seam against a linebacker in man coverage, with only the free safety behind him. Right, the run: seven linemen and tight ends plus the wing make eight blockers for eight defenders before the quarterback reads anyone. Jackson reads the backside 5 (ringed) and the U arcs past him to the safety, so the defense is a man short until the free safety comes down, and the free safety is the man the pass in the left panel is aimed at.

Read Figure 3 as the defense’s coordinator, on the sideline, deciding what to put on the field when three tight ends run on.

If he plays it as a run formation, with base personnel and eight in the box (the answer defenses chose against these snaps about 77% of the time), he is still a man short against the run (right panel): eight blockers plus Jackson’s read against eight. To get even he needs the free safety in the box, and then nobody is deep. Meanwhile his linebackers are covering tight ends. Mark Andrews, who led the 2019 Ravens in catches, was a 6-foot-5 receiver in a tight end’s job description; a linebacker in man coverage on him up the seam (left panel) is the mismatch the formation was built to create.

If he plays it as a pass formation, with smaller players to cover the tight ends, the run arithmetic gets worse: smaller defenders to block, and seven of them in the box against eight blockers and a read.

And here is the surprise. The league ran the ball on about 58% of its 13-personnel snaps in 2019, as you’d expect from a goal-line-looking grouping. **Baltimore threw on 67% of them.**¹⁴ Three tight ends didn’t mean “run” for the Ravens any more than three wide receivers meant “pass”: that season they ran on 49% of their 11-personnel snaps (three receivers), against 29% for the league. The personnel stopped being a tell. That is the deepest point of Roman’s design: once the quarterback is a runner, every grouping can run, so every grouping can also throw, and a defense that reads personnel to guess run or pass, as 02-01 teaches you to, guesses wrong more often against Baltimore than against anyone.

Signature play 3: the QB counter

The third signature play has no read at all. On the **QB counter**, Jackson is the ball carrier from the snap, the running back is a decoy and then a blocker, and two blockers pull across the formation to lead him. 03-04 drew a shotgun version with a guard and tackle pulling. The Ravens’ favourite version used what they had most of: a tight end as the second puller.

¹⁴This book’s calculation from nflverse participation and play-by-play, 2019 regular season: plays with offense personnel “1 RB, 3 TE, 1 WR” (Baltimore: 57 snaps), designed runs as a share of them, for Baltimore and the league; the defense personnel on Baltimore’s 13-personnel snaps; and the same run shares for “1 RB, 1 TE, 3 WR.” The passing figures rest on a few dozen plays; read them as a tendency, not a precise rate.

Figure 4: QB counter from the pistol, 12 personnel, to the right (simulated, in Big Data Bowl coordinates; purple rings mark the two pullers, the green ring the ball, faint lines where each player has been). 1, the snap: eight defenders in the box, the back directly behind the quarterback. 2, Jackson and the back take a step to the left, selling a run that way; the linebackers step with them, while the left guard and the backside tight end (U) start pulling right behind the line. 3, the guard kicks out the play-side 9; the tight end wraps up through the hole the down blocks have made. 4, Jackson follows the tight end into the second level, where the Mike, who first stepped the wrong way, has to take on a blocker; the back has turned around to block the backside 9. Eight blockers for eight defenders, with the quarterback carrying: the running back's block is the hat a handoff can't provide.

Three things make this play the Ravens' and not just anyone's.

The fake is a real threat. The counter step only works if the defense believes the first direction. Against most quarterbacks, the linebackers' first read is the running back: if he steps left, the run is going left. Against Jackson, they have to wonder whether he is about to *pull* the ball and run left himself, so their first step left is bigger, and the cutback right, which is where the counter goes, is bigger too.

The pullers are a tight end and a guard, not two linemen. Pulling the backside tackle, as many counter plays do, leaves the backside end free to chase. Pulling the backside *tight end* keeps the tackle home to block the 5, and the running back, after his fake, turns around and blocks the backside 9 (Figure 4, panel 4). Count the blocks: eight, against eight. That is the designed-run arithmetic of 03-04 with the Ravens' extra tight end supplying the eighth.

It punishes the defense for following the rules. The linebackers who follow the first flow are doing what they're coached to do. The 9 who squeezes the down blocks is doing what he's coached to do. Both are wrong, because the play is built to make their

rules point the wrong way. That is the pattern of the whole offense: not a trick, but a set of plays where each defender’s textbook reaction is the one the next play attacks.

And the cost is the one the chapter keeps coming back to: on every QB counter, Jackson is a ball carrier between the tackles, meeting linebackers and safeties at full speed. The Ravens rationed these runs. How much they rationed them, and how that changed, is in the data.

i Film room: Baltimore Ravens 2019 (watching the pistol)

Earlier chapters have shown the 2019 Ravens from other angles: their personnel and tendencies in 02-01, their early-down efficiency in 10-01, their read menu in 03-04, and the boxes they ran into in 05-05. This time, watch the pistol itself.

What to notice: on any 2019 Ravens broadcast, before each snap, note where the back is. Behind Jackson (pistol) is the base look, and it was most of the snaps. Then, at the snap, watch the **two ends** rather than the ball. One of them is being read and the other is being blocked, and you can usually tell which within a step: the read end is the one nobody touches. Over a quarter, notice how rarely either end chases the back flat down the line. That restraint, the frozen backside, is the hidden yardage of the whole offense: it is there on the plain handoffs too.

The data fingerprint

How good was the Ravens’ run game, how long did it last, and how did it change? Play-by-play data can’t see a read, but it can see the results. Figure 5 compares Baltimore’s designed runs with every other team’s, season by season, using EPA per play (expected points added: how much a play changed the offense’s expected score, 01-02).

Figure 5: Rushing efficiency, regular seasons 2018–2025: EPA per designed run (quarterback scrambles, kneel-downs and botched snaps excluded) for every team (gray dots), the league average (gray line) and Baltimore (blue, with its league rank). In 2018 Jackson started only the last seven games; 2021 and 2022 were cut short by his injuries in December. Shaded bands mark the two offensive coordinators of the era. Data: nflverse play-by-play via nflreadpy.

Four things stand out in Figure 5.

It was the best run game of its time, and it stayed that way. Baltimore’s designed runs ranked 1st, 1st, 13th, 2nd, 3rd, 1st, 3rd in the league from 2019 to 2025, and were above the league average every season. In a league where the average designed run *loses* expected points (the gray line sits below zero every year), the Ravens’ runs gained them, season after season, under two coordinators, with three different lead running backs. Their success rates tell the same story: more than 43% of their designed runs were “successful” every season, against a league that hovered around 41%.

2018 was a different offense halfway through. The season's dot mixes ten weeks of Flacco with seven of Jackson; the split earlier in the chapter (from -0.02 to $+0.08$ per run) is the real story.

The dip is the injuries. 2021 is the one season the Ravens' runs were merely average (13th). Jackson played 12 games before an ankle injury in December ended his season, the team lost its top two running backs before the season began, and Baltimore finished 8–9.¹⁵ 2022 ended the same way, with Jackson hurt in December and backup Tyler Huntley starting the wild-card loss in Cincinnati. Even so, the run game ranked 2nd that year.

Two coordinators, one result, different recipes. The top of the chart is level across the change of coordinator in 2023, which can make it look as if nothing changed. A great deal did. Figure 6 shows the recipes.

Figure 6: How the run game was built, 2018–2025 regular seasons (Baltimore in blue, league average in gray). Top left: Jackson's designed runs (no scrambles, botched snaps or likely sneaks) per game he played. Top right: share of plays with fewer than three wide receivers. Bottom left: share of plays from the pistol (Next Gen Stats formation labels through 2022, FTN charting from 2023; the vertical line marks the change of source). Bottom right: share of plays with the quarterback under center (FTN charting, 2022–2025 only). Data: nflverse play-by-play, participation and FTN charting via nflreadpy.

Read the four panels of Figure 6 as three eras.

The Roman years (2019–2022): the pistol option offense at full strength. Jackson averaged between 5.5 and 7.5 designed runs a game. The pistol was the base alignment (bottom left), at many times the league's rate. And heavy personnel deepened over time: by 2022, Roman's last season, the Ravens had fewer than three wide receivers on the field on 86% of their snaps, more than twice the league's rate, with 22 personnel (two backs, two tight ends) their single most common grouping.¹⁶

¹⁵"2021 Baltimore Ravens season," Wikipedia: https://en.wikipedia.org/wiki/2021_Baltimore_Ravens_season (J. K. Dobbins and Gus Edwards lost to knee injuries before the season; Jackson's ankle injury in Week 14 against Cleveland); "2022 Baltimore Ravens season," Wikipedia: https://en.wikipedia.org/wiki/2022_Baltimore_Ravens_season (Jackson's knee injury in Week 13; Huntley started the wild-card game, a 24–17 loss at Cincinnati). Games played are from nflverse play-by-play.

¹⁶This book's calculation from nflverse participation data, 2022 regular season: Baltimore used 22 personnel on about a third of its plays, more than any other grouping.

The Monken reset (2023). The 2023 bars and lines move together, and all in one direction: Jackson’s designed runs fell to 4.1 a game, the pistol nearly disappeared (7% of plays), the shotgun went to 78%, and heavy personnel fell back toward the league average. That is a coordinator deliberately moving the offense’s center of gravity from the quarterback’s legs to his arm. The section on Monken below tells that story.

The Henry years (2024–2025): under center. With Derrick Henry at running back, the heavy personnel came back but the pistol didn’t. Instead the Ravens put Jackson **under center** on 28% of their plays in 2024 and 35% in 2025, up from 11% in 2022, and by 2025 more often than the league (bottom right). Jackson’s designed runs kept falling, to 2.2 a game in 2025. The run game became a running back’s run game, with the quarterback’s threat held in reserve.

The constant across all three eras is the result in Figure 5. That is the strongest evidence that the Ravens’ advantage was never one play or one formation. It was a quarterback the defense had to account for, and a staff that kept finding new ways to collect on it.

How opponents responded

If the Ravens’ run game was the league’s best for seven years, what did defenses do about it? They tried four broad answers, and each one worked in some games, often in the games that mattered most.

Answer 1: match speed with speed

The Chargers’ seven-defensive-back plan of January 2019 was the first famous answer, and its logic is worth seeing on the field.

The seven-DB answer: speed everywhere

Figure 7: Speed against speed: the idea behind the Chargers’ seven-defensive-back plan in the January 6, 2019 wild-card game (illustrative alignment; the Ravens shown in a pistol 11-personnel look). Four defensive linemen and no linebackers: two safeties (ringed) line up at linebacker depth, a nickel back covers the slot, and two corners and two deep safeties play behind them. The box holds six defenders against six blockers and a read, so on paper the Ravens have the numbers; the defense’s bet is that six fast defenders, every one of whom can run with Jackson to the sideline, will make up the man with pursuit and leave nothing open behind them when the Ravens throw.

The trade in Figure 7 is stark. The defense concedes the box count on paper (six defenders against six blockers and a read), and gives up size at every position: a 210-pound safety at linebacker loses a lot of collisions with a pulling guard. In return, every defender can run. Against a quarterback whose best plays are outside, pursuit from the inside is the defense’s real plus-one, and safeties pursue faster than linebackers do. And a defense of seven defensive backs is already in the right personnel if the offense throws.

Why didn’t everybody copy it? Because it was built for a particular offense at a particular moment. The 2018 Ravens were short on receivers, and Jackson, eight games into his career as a starter, could not yet punish a defense for selling out to his legs. Roman’s 2019 rebuild was in large part a reply to this game. The heavy personnel made small defenders a liability, since six defensive backs can’t hold up against two tight ends and a fullback blocking down on them all afternoon. The passing game, aimed at the middle of

the field with Andrews, punished defenses that took linebackers off it. The seven-DB idea never became a standard defense against Baltimore, but its premise, *speed in the box is worth more than size against this quarterback*, shows up again in the big-nickel and “safety as linebacker” packages many defenses used against the Ravens through 2025.

Answer 2: get ahead and make them throw

The answer that worked best wasn’t schematic. It was the scoreboard. A pistol option offense is built on the run, and the run is most valuable when the game is close. Get ahead by two scores and the offense has to throw, and a team that has spent the week preparing for runs is suddenly defending a passing game built from fewer receivers.

i Film room: Tennessee at Baltimore, January 11, 2020 (divisional round)

The 14–2 Ravens, the AFC’s top seed, lost 28–12 at home to the sixth-seeded Titans, and the game is the clearest example of the scoreboard answer. Tennessee led 14–6 at halftime and 28–6 after three quarters, Derrick Henry ran for 195 yards against the Ravens, and Baltimore spent the second half throwing.¹⁷

The numbers, from the play-by-play: the Ravens trailed by more than a touchdown on 86% of their snaps and called a designed run on only 23% of them; Jackson ran 20 times for 143 yards (many of them scrambles on broken pass plays), Baltimore turned the ball over three times, and it failed on all four of its fourth-down attempts, two of them Jackson runs on fourth-and-1 that were stopped for no gain.¹⁸

What to notice: watch the first quarter and the fourth. In the first, the Ravens are the offense this chapter describes: pistol, reads, runs. In the fourth, they are in the shotgun with four and five receivers, a team built around the run trying to throw its way back from three scores. Tennessee’s plan, as analysts described it at the time, also included more defenders at the second level who could flow to the ball, a version of answer 1, but the scoreboard did the most damage.¹⁹

Answer 3: pressure and zero

The third answer attacked the passing half of the bargain. If the box can’t be made heavy enough to stop the run, and the offense has fewer receivers than usual, send everyone. In a Cover 0 pressure there is no deep safety; every defender either rushes or covers a man, and the quarterback has to beat the blitz with a quick throw before it reaches him. The 2021 Dolphins did this to Jackson on a Thursday night in November 2021, blitzing on most of his dropbacks and playing zero coverage behind it, and won easily against a team that had been 6–2. 10-02 has the numbers and the film.

Why does it fit this offense? Zero coverage gives up the deep middle, and the quarterback is the man best equipped to punish it by running, so it is a real gamble. But it also takes away the *time* a play-action pass needs: a heavy formation’s fake pulls linebackers up, but a blitzing linebacker was coming up anyway. The Ravens’ longer-term answer was the one the next sections describe: a passing game with more receivers who could win quickly, built under a new coordinator.

Answer 4: spy him and disguise it

The fourth answer is the most direct: assign one defender to Jackson, a **spy**, and hide which one. The Chiefs did it with linebacker Leo Chenal in 2024; the Lions did it in 2025 with a plan their coordinator credited not to the spy but to making every defender look the same before the snap. 10-02 tells both games. The cost of a spy is the cost of every answer in this list: a defender assigned to the quarterback is not in coverage and not filling a gap, and against a running quarterback that is simply the price of admission.

What the answers have in common

Look at the four together and a pattern appears. None of them *stopped* the run game for a season; the chart in Figure 5 says so. What they did was **make the Ravens play from behind, or make them throw against a defense built to stop the throw**, in single games. That is the honest summary of the era’s defensive history, and it leads straight to the question every Ravens fan has argued about.

¹⁷“2019–20 NFL playoffs,” Wikipedia: https://en.wikipedia.org/wiki/2019%E2%80%9320_NFL_playoffs; Henry’s 195 rushing yards and the score by quarter are confirmed by nflverse play-by-play ([game_id 2019_19_TEN_BAL](#)).

¹⁸This book’s calculation from nflverse play-by-play, [game_id 2019_19_TEN_BAL](#): Baltimore’s share of snaps trailing by more than seven points and of designed runs, its turnovers, Jackson’s 20 carries for 143 yards, and its four fourth-down plays (two Jackson runs on fourth-and-1, in the second and third quarters, and two incomplete passes in the fourth).

¹⁹Danny Kelly, The Ringer (September 10, 2020), on how defenses might solve the Ravens’ read-option offense, including Tennessee’s plan in the divisional round: <https://www.theringer.com/nfl/2020/9/10/21430211/lamar-jackson-read-option-offense-nfl-solve>.

The playoffs, honestly

From the 2018 season through 2024, the Ravens with Jackson at quarterback went 3–5 in the playoffs and never reached a Super Bowl. “Can’t win in January” became the era’s caption. What does the data say?

Figure 8: Baltimore’s nine playoff games, 2018–2024 seasons, against the regular season. Left: EPA per play in each game (filled dots are wins, open dots losses; the gray line is the Ravens’ average across the Jackson-era regular seasons, from week 11 of 2018). The January 2023 game in Cincinnati was started by Tyler Huntley. Right: three things that separate the playoff games from the regular season: the share of snaps played while trailing by more than a touchdown, the share of plays that were designed runs, and turnovers per game. Data: nflverse play-by-play and schedules via nflreadpy.

Three readings, from least to most important.

The offense was worse in the playoffs, a lot worse. Across the Jackson-era regular seasons the Ravens averaged +0.089 EPA per play, an elite offense. In their nine playoff games they averaged –0.008, roughly an average one, and their designed runs went from +0.08 per play to –0.02. That part of the narrative is true. Playoff opponents are better than regular-season ones, and the Ravens’ playoff opponents had time to prepare for an offense unlike anyone else’s, but the drop is bigger than either explains on its own.

The losses came from falling behind and giving the ball away. The right panel is the mechanism. In the regular season the Ravens trailed by more than a touchdown on only 10% of their snaps; in the playoffs, on 37%. They turned the ball over 1.1 times a game in the regular season and 1.8 in the playoffs, three or more in five of the six losses. And trailing changes the offense: the share of designed runs fell from 46% to 41%. This is answer 2 from the last section, playing out across a decade: a run game built to win close games was asked, again and again, to win from behind.

The run game was rarely the reason. Look at the losses one at a time. Against the Chargers in 2019 and the Titans in 2020 the run game was stuffed, but both games were decided by early deficits and turnovers. In the January 2024 AFC Championship against Kansas City, the Ravens trailed 17–7 at halftime and ran only 16 times all game, with their running backs carrying six of them; their designed runs averaged +0.17 EPA, better than their regular-season average, and they lost 17–10 after three turnovers.²⁰ In January 2025 at Buffalo they ran for 176 yards and still lost 27–25, after an interception, a fumble on a sack and a Mark Andrews fumble, then a failed two-point conversion that would have tied the game.²¹ The playoff losses look less like a scheme being solved and more like an offense built on the run being taken out of it by the scoreboard.

How much of that is bad luck? Some, certainly: nine games, about 597 plays, is a small sample, and turnovers in particular are noisy from game to game. But a pattern repeated across six seasons, three running backs and two coordinators deserves an explanation,

²⁰This book’s calculation from nflverse play-by-play, `game_id 2023_21_KC_BAL`: 16 rushing attempts (Jackson 8, Gus Edwards 3, Justice Hill 3, Zay Flowers 2), three turnovers, Kansas City ahead 17–7 at halftime.

²¹This book’s calculation from nflverse play-by-play, `game_id 2024_20_BAL_BUF`: 30 rushes for 176 yards; an interception in the first quarter, a fumble on a sack in the second, Andrews’s fumble in the fourth, and the failed two-point conversion (a pass to Andrews) with about 1:33 to play; final score 27–25.

and the most honest one is this: the pistol option offense was at its best protecting a lead or playing even, and the games it lost were the games where it had to do the thing it was built to do least. The 2023 change of coordinator was, in part, an attempt to fix exactly that.

i Madden vs. real life

In a video game, a great offense is great in every situation, because you can call any play from any score. Real offenses are built for a *range* of situations: personnel, practice time and a quarterback's skills all get spent on the situations the staff expects most. An offense built to run is spending its practice week on runs, and when it falls behind by fourteen, it is asking players to win with the part of the playbook they practised least. That is a trade-off, not a flaw, and every offense makes one.

The Monken changes (2023)

After the 2022 season Greg Roman left. The Ravens' offense under him had ranked first, seventh, 17th and 19th in points in his four years as coordinator, and the passing game had never quite caught up to the run.²² In February 2023 Baltimore hired **Todd Monken**, who had just won two straight national championships as Georgia's offensive coordinator and had run NFL offenses in Tampa Bay and Cleveland.²³

Monken's mandate was to make Jackson a quarterback who could win from the pocket, without throwing away what made him dangerous. Figure 6 shows what he did:

- **From the pistol to the shotgun.** Pistol snaps fell from 26% of plays in 2022 to 7% in 2023, and the shotgun rose to 78%.²⁴ The shotgun gives the quarterback a better view of the coverage and a faster launch, at the cost of the pistol's downhill back and its lack of a tell.
- **Fewer designed quarterback runs.** Jackson's designed runs fell from 5.5 a game to 4.1. He still ran, but more of it was scrambling, improvising when a pass play broke down, rather than running on purpose.
- **More receivers, and more passing on early downs.** The Ravens drafted receiver Zay Flowers in the first round, used three-receiver sets more, and on neutral early downs ran the ball on 43% of plays, 27th in the league, after ranking first in that category in 2019.

The result was Jackson's best passing season to that point and his second MVP award, won with 49 of 50 first-place votes, and a 13–4 record and the AFC's top seed.²⁵ The run game didn't collapse without the volume of quarterback runs. It ranked 3rd in EPA per designed run, and the Ravens still led the league in rushing yards. The threat was doing the work the carries used to do: a backside end who had to respect Jackson every snap was still frozen, whether Jackson ran six times or four.

²²NFL.com, "Ravens, offensive coordinator Greg Roman part ways after six seasons" (January 2023), with the offense's rankings in yards and points under him: <https://www.nfl.com/news/ravens-offensive-coordinator-greg-roman-part-ways-after-six-seasons>.

²³CBS Sports, "Ravens hire Todd Monken as offensive coordinator: Georgia assistant returns to NFL to replace Greg Roman" (February 14, 2023): <https://www.cbssports.com/nfl/news/ravens-hire-todd-monken-as-offensive-coordinator-georgia-assistant-returns-to-nfl-to-replace-greg-roman>.

²⁴This book's calculation from nflverse FTN charting (qb_location: U, S or P), regular seasons 2022–2025, joined to play-by-play on game and play ID.

²⁵NFL.com, "Ravens QB Lamar Jackson wins AP 2023 NFL Most Valuable Player award" (February 8, 2024; 49 of 50 first-place votes): <https://www.nfl.com/news/ravens-qb-lamar-jackson-wins-ap-2023-nfl-most-valuable-player-award>.

²⁶Running back carries and the halftime score are from nflverse play-by-play (game_id 2023_21_KC_BAL); the divisional-round score from nflverse schedules. The three turnovers, as the play-by-play describes them: Jackson sacked and stripped in the second quarter; Flowers's fumble after a catch at the Kansas City 1, recovered for a touchback, on the first play of the fourth; and an interception in the end zone (intended for Isaiah Likely) later in the fourth.

The Ravens beat Houston 34–10 in the divisional round, then hosted the Chiefs for a trip to the Super Bowl. They lost 17–10, and the game became the sharpest criticism of the Monken offense: Baltimore ran only 16 times, and its running backs carried just six of those.²⁶

What to notice: the first half and the turnovers, not the play-calling alone. Kansas City led 17–7 at halftime, and the Ravens turned the ball over three times: a fumble on a sack in the second quarter, then, in the fourth, Zay Flowers’s fumble at the Kansas City 1-yard line and an interception in the end zone. Watch Steve Spagnuolo’s defense on Jackson’s dropbacks: four-man rushes, disguised coverages, and rushers who kept their lanes so that Jackson’s scrambles went nowhere. Then ask the question the chapter keeps asking: was the run abandoned, or was it taken away by the scoreboard? The answer is some of both, and it was the last time the Ravens’ run game rested mainly on Jackson.

The Derrick Henry seasons (2024–2025)

In March 2024 the Ravens signed **Derrick Henry**, the 30-year-old former Titans back who had run for 2,027 yards in 2020 and had beaten them almost single-handedly in that January 2020 playoff game, on a two-year contract.²⁷ It was a signing that made the threat run both ways. For five years, defenses had to decide whom to fear on a read: the quarterback or a good running back. Now the back was one of the most punishing runners of his generation, a 247-pound back who had led the league in rushing twice.

2024 was the best offense of the era. Henry ran for 1,921 yards and 16 touchdowns, second in the league in yards behind Saquon Barkley’s 2,005; Jackson threw for 4,172 yards, 41 touchdowns and only four interceptions; and Baltimore led the NFL in EPA per play, in rushing yards, and, again, in EPA per designed run.²⁸ The team went 12–5, beat Pittsburgh in the wild-card round as Henry ran for 186 yards, and lost at Buffalo, the game described above.

The run game moved under center. The data shows how differently the Henry offense was built. The Ravens took 28% of their 2024 snaps with Jackson under center, nearly three times their 2022 rate, and 45% of their designed runs started there. Henry is a downhill back who wants to hit the line with speed, and taking the snap under center lets him get the ball deep in the backfield, running forward, on zone, duo and gap runs, with play-action passes built off the same look. The read game didn’t vanish; it got rarer, and it kept its best form. Henry’s carries from the pistol, 92 of them across the two seasons, averaged 7.8 yards and +0.21 EPA, against 5.1 yards and +0.09 EPA from under center.²⁹ The small pistol sample is the read offense in miniature: an end who has to stay home for Jackson is an end who isn’t chasing Henry.

2025 was the end. Jackson missed four games with injuries and was less of a runner when he played: by this chapter’s count 28 designed runs in 13 games, about two a game. Henry still ran for more than 1,500 yards, the run game still ranked 3rd in EPA per designed run, and the Ravens ran on early downs more than all but one team. But a 1–4 start, a defense that gave up 398 points, and a 26–24 loss at Pittsburgh in Week 18 with the division on the line left them 8–9 and out of the playoffs.³⁰ On January 6, 2026, the Ravens fired John Harbaugh after 18 seasons.

What survives: the era closed, and the 2026 epilogue

The coaches have scattered. Harbaugh is the Giants’ head coach in 2026, Monken is the Browns’ head coach, and Roman spent 2024 and 2025 as Jim Harbaugh’s offensive coordinator with the Chargers. The 2026 Ravens belong to **Jesse Minter**, the former Ravens assistant and Chargers defensive coordinator, as head coach, with **Declan Doyle**, who came from Ben Johnson’s Chicago

²⁷ *Sports Illustrated*, “Ravens signing RB Derrick Henry to two-year deal” (March 12, 2024): <https://www.si.com/nfl/2024/03/12/ravens-signing-rb-derrick-henry-to-two-year-deal>. Henry’s 2,027 yards in 2020 and his listed weight are from “Derrick Henry,” Wikipedia: https://en.wikipedia.org/wiki/Derrick_Henry.

²⁸ Henry’s 1,921 yards and 16 touchdowns and Jackson’s 4,172 yards, 41 touchdowns and 4 interceptions are confirmed in nflverse play-by-play, 2024 regular season; Barkley’s 2,005: NFL.com, <https://www.nfl.com/news/saquon-barkley-becomes-ninth-player-to-rush-for-2000-yards-in-a-season>. The team ranks (EPA per play, rushing yards, EPA per designed run) are this book’s calculation from the same data; the wild-card score and Henry’s 186 yards from nflverse schedules and play-by-play.

²⁹ This book’s calculation from nflverse play-by-play and FTN charting, 2024–2025 regular seasons: Henry’s designed runs by the quarterback’s alignment. The pistol sample is small; read it as a direction, not a size.

³⁰ Baltimore’s 2025 results (8–9; 424 points scored, 398 allowed; a 26–24 loss at Pittsburgh on January 4, 2026; Jackson’s starts) are from nflverse schedules. Pittsburgh won the AFC North at 10–7: see FACTS-current §2 and “2025–26 NFL playoffs,” Wikipedia: https://en.wikipedia.org/wiki/2025%E2%80%9326_NFL_playoffs. Harbaugh’s firing on January 6, 2026, after 18 seasons: “2026 NFL season,” Wikipedia: https://en.wikipedia.org/wiki/2026_NFL_season.

staff, as offensive coordinator and **Anthony Weaver** as defensive coordinator.³¹ Jackson is still the quarterback. What Doyle builds around him is a 2026 story, and this chapter stops at the end of 2025.

What survives the era is bigger than one team.

- **The arithmetic is now conventional wisdom.** “Count the quarterback as a blocker” was an option coach’s slogan in 2018. By 2025 it was how every NFL defense planned for Jalen Hurts, Josh Allen and Jayden Daniels, and how every analyst explained why those offenses ran well against light boxes.
- **Heavy personnel came back.** In 2025 NFL offenses used fewer than three receivers on 41.7% of plays, the most since Next Gen Stats began tracking.³² The Ravens weren’t the only cause (the 49ers, Rams and Eagles all pushed the same way), but they showed that a modern offense could live in 12, 21 and 22 personnel and still throw.
- **The quarterback run became a managed resource.** The Ravens’ own data tells the story of the last seven years in miniature: from seven or eight designed runs a game in 2019 to about two in 2025, with the efficiency of the run game barely moving. The lesson the league took is that a running quarterback’s value is mostly in the *threat*, which can be spent a few carries at a time, on the downs and in the games where it matters, and saved the rest of the time.
- **The pistol didn’t.** The pistol as a *base* alignment was a Ravens thing, and it left with Roman. It survives as a run-heavy niche look (02-02’s data has a few teams living in it), and as the backfield of choice for read plays from under-center teams. That is a good example of the course’s larger point: the principle (an extra blocker, either side, no tell) outlived its favourite formation.

💡 Watch for it

On Sunday: count the defenders against a running quarterback. Any team with a quarterback who runs, Baltimore or not, will do.

Before the snap

- **Count the blockers:** five linemen, plus every tight end and fullback near the line.
- **Count the box:** every defender within about five yards of the ball and inside the tight ends.
- **Add the quarterback.** If he’s in the pistol or shotgun with a back beside or behind him and is a real runner, add one to the offense’s side. Now compare: more defenders than blockers-plus-one, and the defense has its plus-one; even, and the defense’s extra man has to come from a safety.
- **Find where the extra man is.** A safety walked down at eight yards, or a single deep safety in the middle? Then the play-action pass is aimed at him.
- **Where is the back?** Directly behind the quarterback (pistol): no directional tell. Beside him: note the side, and expect the run (or the read) to go the other way.

At the snap

- **Watch the two ends.** The one nobody touches is being read. Does he stay home (give coming) or chase (keep coming)?
- **Look for a puller.** A guard pulling toward the unblocked end: power read. A guard and a tight end pulling the same way while the quarterback steps the other way: QB counter.

After the play

- On the replay, check the backside end on a plain handoff. Did he chase the cutback, or stay home for a quarterback who didn’t have the ball? Count how often he stays, over a quarter. That is the hidden yardage.
- Note the score. Is the offense still running when it’s behind by two scores? That’s the question that decided the Ravens’ playoff games.

³¹Pro Football Rumors, 2026 offensive and defensive coordinator search tracker (Doyle from Chicago to Baltimore; Weaver as defensive coordinator; Monken to Cleveland as head coach): <https://www.profootballrumors.com/2026/02/2026-nfl-offensive-defensive-coordinator-search-tracker>; head coaches (Minter to Baltimore, Harbaugh to the Giants): “2026 NFL season,” Wikipedia, cited above.

Predict the play

💡 Predict the play

Drill 1: eight in the box. First-and-10 at midfield, first quarter, tied. Baltimore is in the pistol with two tight ends; the defense walks a safety down and shows eight in the box with one deep safety. Count the blockers and the box with Jackson as a runner. Who is the defense's extra man, and which Ravens play does this picture invite?

Drill 1: 1st and 10, midfield

Figure 9: Drill 1: pistol 12 personnel against an eight-man box and a single deep safety (the wide receivers and cornerbacks are out of the picture).

Answer 1 is at the end of the chapter. Try it first.

D.

Drill 2: the 9 squeezes

Figure 10: Drill 2: the pistol power read a moment after the snap. The play-side 9 (ringed) has squeezed inside (his short arrow); the line's blocks are drawn, and the back (thin arrow) is sweeping right.

Answer 2 is at the end of the chapter. Try it first.

💡 Predict the play

Drill 3: down fourteen. Second-and-8 at your own 30, early in the third quarter of a playoff game. You're down 14. The defense shows two deep safeties and only six in the box. Your quarterback is a great runner; your offense has the league's best run game. Does the box say run? Does the scoreboard? What would you call, and what does the Ravens' history say about the trap in this picture?

Drill 3: 2nd and 8, down 14, third quarter

Figure 11: Drill 3: shotgun 11 personnel (one tight end, three receivers) against a two-high shell with six in the box; the offense is down 14 early in the third quarter.

Answer 3 is at the end of the chapter. Try it first.

Takeaways

- The 2019–2022 Ravens built a **pistol option offense**: the pistol as the base alignment, heavy personnel, a menu of option reads and designed quarterback runs, so that the defense had to account for one more ball carrier on every snap.
- A running quarterback changes **every** run fit, not just the reads: the end he might read has to stay home on plain handoffs too, every defender's fit gets a "quarterback" line, and backside pursuit stops being free. An eight-man box against him is a seven-man box.
- The signature plays each make a defender's textbook reaction wrong: the **pistol inverted veer** (squeeze the hole and the back runs outside you), **13 personnel** (play it as a run formation and the seam opens; Baltimore threw from it two times in three), and the **QB counter** (follow the first flow and the play goes back the other way).
- The data fingerprint: Baltimore's designed runs were above the league average **every season** from 2018 to 2025, top three in six of them, under two coordinators and three lead backs. What changed was the recipe: pistol and quarterback runs under Roman, the shotgun and fewer designed runs under **Monken (2023)**, under-center runs with **Derrick Henry (2024–2025)**.
- Defenses answered with speed, pressure, spies and, most effectively, **the scoreboard**. The playoff record (3–5 with Jackson) came mostly from early deficits and turnovers that pulled a run-first offense away from the run, not from the run game being solved.
- The era closed in January 2026 with Harbaugh's firing. What survives is the arithmetic (count the quarterback as a blocker), heavy personnel, and the idea that a running quarterback's value is mostly the threat, spent a few carries at a time.

Connections

Builds on: Option Football (every read and designed run this chapter uses), Run Fits: Gap Integrity, Force, Spill, and Box Math (the plus-one and the fit chart), Personnel Groupings and Formation Rules and Vocabulary (heavy personnel and the pistol), and The Modern Era (the league around these Ravens).

Sets up and connects to:

- Third Down: the spies and Cover 0 pressures defenses used on Jackson, in detail.
- Early Downs and Field Zones: why an efficient run game can be called often, and why the scoreboard decides.
- Win Probability and Fourth Down: the tool for Drill 3's question.
- The other case studies of the era: The Eagles' Trenches, RPOs, and the Tush Push (another quarterback run game, built differently) and Fangio's Two-High Revolution and Macdonald's Answer (the light-box defenses of the same years; Mike Macdonald was the Ravens' defensive coordinator in 2022 and 2023).

If you want to go deeper: the Ravens' own press-conference transcripts from 2019 (Roman's, especially), which are unusually candid about the design; Chris B. Brown's Smart Football essays on the pistol and the inverted veer and his *The Art of Smart Football*; Chris Ault's clinic talks on the Nevada pistol; and, for the data, this chapter's code, which runs on the free nflverse data and can be pointed at any team with a running quarterback.

i Go deeper

From the simulation to real tracking data. The QB counter animation in this chapter is a gridiron simulation written in NFL Big Data Bowl coordinates (simulated, BDB-format), so real tracking frames drop into the same drawing code. The Big Data Bowl releases carry the play-by-play description of each play, so finding a Jackson designed run is a text search ("L. Jackson" as the rusher, no "scramble"), and the pre-snap frames of the 2025 edition show whether he was in the pistol. The cell below, folded on the website and not run (the course does not download the Big Data Bowl files), shows the shape of that code.

Answers to Predict the play

Answer 1.

Seven blockers plus Jackson's read against eight: a hat on every hat. Five linemen and two tight ends make seven blockers. The box has eight: six on the line and two linebackers. On a handoff with a pocket quarterback the defense would be plus-one. With Jackson reading one end, it is even (Figure 1, Figure 2).

The defense's extra man is the free safety, the only defender not in the box and the only one deep. If he comes down to stop the run, there is nobody behind the linebackers.

What it invites: any of the reads, which is the point of the arithmetic, but most of all a **play-action pass at the deep middle**. Eight in the box against the Ravens meant the defense had spent its last spare man; a fake to the back that holds the linebackers and the safety for a beat, with a tight end up the seam behind them, is the play this picture is begging for (Figure 3, left).

Answer 2.

Give. The 9 has squeezed inside, toward the hole the quarterback would run through: he has taken the keep away himself. So Jackson hands the ball to the back, who is already running outside the 9 at full speed (Figure 2).

Who has to tackle him? Nobody in the box: every other box defender is blocked, and the 9 is inside the runner. The tackle has to come from **outside or behind**: the cornerback on that side (if the wide receiver hasn't blocked him) or the free safety, coming from 12 yards deep across the field. That is the power read's promise, a running back in space against a defensive back, and its risk: if the corner or safety arrives in time and the back was running sideways, the gain is small.

If the 9 had **widened** with the back instead, the answer flips: keep, and Jackson runs inside him behind the pulling guard.

Answer 3.

The box says run. Six defenders against six blockers (five linemen and the tight end) and a quarterback who reads: the offense is effectively plus-one. Against light boxes, efficient running teams do well, and the Ravens were the most efficient running team of their era (Figure 5).

The scoreboard says "don't panic." Down 14 with more than a quarter and a half to play is two possessions, not a two-minute drill. A good run on second-and-8 is a good play in any quarter, and an offense built on the run that abandons it at the first deficit plays into the defense's hands, which is exactly what this two-high shell is inviting: if you throw against two deep safeties and six underneath, you are throwing into the coverage the defense chose. (The win-probability tools of 13-03 make this precise.)

The trap is the one in Figure 8. Deficits pushed the Ravens out of their offense in the playoffs (their designed-run share fell from about 46% to 41%), and turnovers, more common when a run team throws from behind, made the deficits bigger. The right call

here is probably the run the defense is conceding (a read, or a designed run with the back blocking), and the right *plan* is to stay patient for another series. The two-score deficit becomes a three-score deficit far more often from an interception than from a three-yard run.
